Conductivity (2.2.38). The conductivity of the test solution does not exceed the conductivity of the water by more than $75 \mu\text{Scm}^{-1}$.

Use as test solution the supernatant liquid obtained in the test for pH. Measure the conductivity of the supernatant liquid after a stable reading has been obtained and measure the conductivity of the water used to prepare the test solution.

Ether-soluble substances: maximum 0.05 per cent (5 mg) for the difference between the weight of the residue and the weight obtained from a blank determination.

Place 10.0 g in a column about 20 mm in internal diameter and pass 50 ml of *peroxide-free ether R* through the column. Evaporate the eluate to dryness and weigh. Carry out a blank determination under the same conditions.

Water-soluble substances: maximum 0.25 per cent (12.5 mg) for the difference between the weight of the residue and the weight obtained from a blank determination.

Shake 5.0 g with 80 ml of *water R* for 10 min. Filter with the aid of vacuum into a tared flask. Evaporate to dryness on a

water-bath. Dry at 100-105 °C for 1 h and weigh. Carry out a blank determination under the same conditions.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram and with a limit for fungi of 10² per gram, determined by plate count. It complies with the tests for *Escherichia coli*, for *Pseudomonas aeruginosa*, for *Staphylococcus aureus* and for *Salmonella* (2.6.13).

Solubility: practically insoluble in water, slightly soluble in a 50 g/l solution of sodium hydroxide, practically insoluble in acetone, in ethanol, in toluene, in dilute acids and in most organic solvents.

IDENTIFICATION

A. Place about 10 mg on a watch-glass and disperse in 2 ml of *iodinated zinc chloride solution* R. The substance becomes violet-blue.

B. The degree of polymerisation is 440 to 2250.

Transfer 0.250 g to a 125 ml conical flask. Add 25.0 ml of *water* R and 25.0 ml of *cupriethylenediamine hydroxide solution* R. Immediately purge the solution with *nitrogen* R, insert the stopper and shake until completely dissolved. Transfer 7.0 ml of the solution to a suitable capillary viscometer (2.2.9). Equilibrate the solution at 25 ± 0.1 °C for at least 5 min. Record the flow time *t*₁ in seconds, between the 2 marks on the viscometer. Calculate the kinematic viscosity *ν*₁ of the solution using the formula:

$$t_1 (k_1)$$

where *k*₁ is the viscometer constant.

Dilute a suitable volume of *cupriethylenediamine hydroxide solution* R with an equal volume of *water* R and measure the flow time *t*₂ using a suitable capillary viscometer. Calculate the kinematic viscosity *ν*₂ of the solvent using the formula:

$$t_2 (k_2)$$

where *k*₂ is the viscometer constant.

Determine the relative viscosity *η*_{rel} of the substance to be examined using the formula:

$$\nu_1/\nu_2$$

Determine the intrinsic viscosity [*η*]_c by interpolation, using the intrinsic viscosity table (Table 0315.-1).

Calculate the degree of polymerisation, *P*, using the formula:

$$\frac{95 [\eta]_c}{m [(100 - b) / 100]}$$

where *m* is the mass in grams of the substance to be examined and *b* is the loss on drying as a percentage.

01/2005:0315

CELLULOSE, POWDERED

Cellulosi pulvis

DEFINITION

Purified, mechanically disintegrated cellulose prepared by processing alpha-cellulose obtained as a pulp from fibrous plant material.

CHARACTERS

Appearance: white or almost white, fine or granular powder.

Table 0315.-1. – *Intrinsic viscosity table*

TESTS

Solubility. Dissolve 50 mg in 10 ml of *ammoniacal solution of copper tetrammine R*. It dissolves completely, leaving no residue.

pH (2.2.3): 5.0 to 7.5 for the supernatant liquid.

Mix 10 g with 90 ml of *carbon dioxide-free water R* and allow to stand with occasional stirring for 1 h.

Ether-soluble substances: maximum 0.15 per cent (15 mg) for the difference between the weight of the residue and the weight obtained from a blank determination.

Place 10.0 g in a column about 20 mm in internal diameter and pass 50 ml of *peroxide-free ether R* through the column. Evaporate the eluate to dryness and weigh. Carry out a blank determination under the same conditions.

Water-soluble substances: maximum 1.5 per cent (75.0 mg) for the difference between the weight of the residue and the weight obtained from a blank determination.

Shake 5.0 g with 80 ml of *water R* for 10 min. Filter with the aid of vacuum into a tared flask. Evaporate to dryness on a water-bath. Dry at 100-105 °C for 1 h and weigh. Carry out a blank determination under the same conditions.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 6.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.3 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 micro-organisms per gram and with a limit for fungi of 10^2 per gram, determined by plate count. It complies with the tests for *Escherichia coli*, for *Pseudomonas aeruginosa*, for *Staphylococcus aureus* and for *Salmonella* (2.6.13).

CHARACTERS

Centaury has a very bitter taste.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The hollow cylindrical, light green to dark brown stem has longitudinal ridges, and is branched only in its upper part. The sessile leaves are entire, decussately arranged, and have an ovate to lanceolate lamina, up to about 3 cm long. Both surfaces are glabrous and green to brownish-green. The inflorescence is diaxially branched. The tubular calyx is green and has five lanceolate, acuminate teeth. The corolla consists of a whitish tube divided in five elongated lanceolate pink lobes, about 5 mm to 8 mm long. Five stamens are present attached to the top of the corolla tube. The ovary is superior and has a short style, a broad bifid stigma and numerous ovules. Cylindrical capsules, about 7 mm to 10 mm long, with small brown markedly rough seeds are frequently present.

B. Reduce to a powder (355). The powder is greenish-yellow to brownish. Examine under a microscope, using *chloral hydrate solution R*. The powder shows numerous fragments of stem containing sclerenchymatous fibres and narrow vessels with bordered pits or spiral of reticulate thickening, as well as rectangular pitted cells of the pith and medullary rays; fragments of leaves with sinuous epidermal cells and striated cuticle, especially over the margins and surrounding the stomata, anisocytic stomata (2.8.3) and cells of the mesophyll with crystals of calcium oxalate of various types; fragments of calyx and corolla, those of the calyx with straight-walled epidermal cells, epidermis of the corolla with obtuse papillae and radially striated cuticle; parts of the endothecium with reticulate or ridge-shaped wall thickenings; triangularly rounded to elliptical, yellow pollen grains, about 30 µm in diameter, with a finely grained exine and three germinal pores; fragments of the wall of the fruit capsule composed of crossed layers of fusiform cells; small yellowish-brown seeds with a raised reticulate, dark brown structure formed by the coarse lateral walls of their epidermis.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. To 1.0 g of the powdered drug (355) add 20 ml of *methanol R* and heat under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve 10 mg of *rutin R* in 10 ml of *methanol R*.

01/2005:1301

CENTAURY

Centaurii herba

DEFINITION

Centaury consists of the whole or cut dried flowering aerial parts of *Centaureum erythraea* Rafn (*C. minus* Moench, *C. umbellatum* Gilib., *Erythraea centaurium* (L.) Pers.).

Apply to the plate as bands 30 µl of the test solution and 10 µl of the reference solution. Develop over a path of 12 cm using a mixture of 16 volumes of *anhydrous acetic acid R*, 16 volumes of *water R* and 68 volumes of *ethyl acetate R*. Allow the plate to dry in a current of cold air and develop again in the same manner. Allow the plate to dry in a current of cold air. Examine the plate in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows as the main quenching zone a strong zone (swertiamarin) similar in position to the quenching zone of rutin in the chromatogram obtained with the reference solution; further weaker quenching zones may also be present. Spray the plate with *anisaldehyde solution R*. Examine in daylight whilst heating at 100 °C to 105 °C for 5 min to 10 min. The chromatogram obtained with the reference solution shows a yellowish-brown zone (rutin). The chromatogram obtained with the test solution shows: a violet-brown zone (swertiamarin); a little above this zone, a faint yellowish-brown zone; and above this a few, very faint, mostly grey zones leading to a reddish-violet zone at the solvent front. Examine the plate in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows: a strong brown to brownish-yellow fluorescent zone (swertiamarin); a little above this zone, a blue to yellowish-green fluorescent zone; and above this a few faint blue to yellow fluorescent zones, leading to a faint reddish-violet fluorescent zone at the solvent front. Below the zone due to swertiamarin occur zones of intense light green to yellowish-green fluorescence as well as a number of faint brown fluorescent zones.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent.

Bitterness value. Not less than 2000. The bitterness value is determined by comparison with quinine hydrochloride, the bitterness value of which is set at 200 000; the bitterness value is the reciprocal of the dilution that still has a bitter taste.

Quinine hydrochloride stock solution. Dissolve 0.100 g of *quinine hydrochloride R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

Centaury extract. To 1.0 g of powdered drug (355) add 1000 ml of boiling *water R*. Heat on a water-bath for 30 min, stirring continuously. Allow to cool and dilute to 1000 ml with *water R*. Shake vigorously and filter, discarding the first 20 ml of filtrate.

Prepare a series of dilutions by placing in the first tube 4.2 ml of quinine hydrochloride stock solution and increasing the volume by 0.2 ml in each subsequent tube to a total of 5.8 ml; dilute the contents of each tube to 10.0 ml with *water R*. Determine as follows the dilution with the lowest concentration that still has a bitter taste. Take 10.0 ml of the weakest solution into the mouth and pass it from side to side over the back of the tongue for 30 s. If the solution is not found to be bitter, spit it out and wait for 1 min. Rinse the mouth with *water R*. After 10 min, use the next dilution in order of increasing concentration.

Calculate the correction factor *k* from the expression:

$$\frac{5.00}{n}$$

n = number of millilitres of quinine hydrochloride stock solution in the dilution of lowest concentration that is bitter.

Dilute 10/*k* ml of the centaury extract to 20.0 ml with *water R*. 10.0 ml of this dilution has a bitter taste.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 6.0 per cent.

STORAGE

Store protected from light.

01/2005:1498

CENTELLA

Centellae asiaticae herba

DEFINITION

Centella consists of the dried, fragmented aerial parts of *Centella asiatica* (L.) Urban. It contains not less than 6.0 per cent of total triterpenoid derivatives, expressed as asiaticoside (C₄₈H₇₈O₁₉; *M_r* 959.15), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

The leaves are very variable in size; the petiole is usually 5 to 10, sometimes 15, times longer than the lamina, which is 10 mm to 40 mm long and 20 mm to 40 mm, sometimes up to 70 mm, wide.

IDENTIFICATION

- A. The leaves are alternate, sometimes grouped together at the nodes, reniform or orbicular or oblong-elliptic and have palmate nervation, usually with seven veins, and a crenate margin. Young leaves show a few trichomes on the lower surface while adult leaves are glabrous. The inflorescence, if present, is a single umbel which usually consists of three flowers, rarely two or four; the flowers are very small (about 2 mm) pentamerous and have an inferior ovary; the fruit, a brownish-grey, orbicular cremocarp, up to 5 mm long, is very flattened laterally and has seven to nine prominent curved ridges.
- B. Reduce the drug to a powder (355). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous fragments of leaf epidermis with polygonal cells having an irregularly striated cuticle, and paracytic stomata (2.8.3) that are more numerous in the lower epidermis; fragments of petiole epidermis with elongated cells; uniseriate, long, flexuous unicellular covering trichomes, occasionally multicellular; young leaves; spiral vessels; resiniferous canals; calcium oxalate prisms and macles up to 40 µm in diameter; bundles of narrow septate fibres from the stem; fragments of the fruit: layers of wide cells in a parquetry arrangement, annular vessels, parenchyma cells containing simple or compound starch granules.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. To 5.0 g of the powdered drug (355) add 50 ml of *alcohol (30 per cent V/V) R*; heat to boiling under a reflux condenser and centrifuge.

Reference solution. Dissolve 5 mg of *asiaticoside R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 11 volumes of *acetic acid R*, 11 volumes of *formic acid R*, 27 volumes

of *water R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray with *anisaldehyde solution R* and heat at 100 °C to 105 °C. Examine in daylight. The chromatograms obtained with the reference and the test solutions show in the lower third a greenish-blue zone (asiaticoside). The chromatogram obtained with the test solution shows also below this zone a violet zone (madecassoside); near the solvent front it shows a light blue zone (asiatic acid) and just below a pinkish-violet zone (madecassic acid); in the lower half it shows brown, grey and brownish-green zones between the starting point and the zone due to madecassoside, and other brownish-yellow or light yellow zones above the zone due to asiaticoside.

TESTS

Foreign matter (2.8.2). Not more than 7 per cent of which not more than 5 per cent of underground organs and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 12.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Place 5.0 g of the powdered drug (355) in a cellulose fingerstall in a continuous extraction apparatus (Soxhlet type). Add 100 ml of *methanol R* and heat for 8 h. Cool and dilute the extract to 100.0 ml with *methanol R*. Filter through a 0.45 µm filter. Dilute 2.0 ml of the filtrate and dilute to 20.0 ml with *methanol R*.

Reference solution. Dissolve 20.0 mg of *asiaticoside R* in *methanol R*, if necessary using sonication, and dilute to 20.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:
Mobile phase A. Acetonitrile for chromatography *R*,
Mobile phase B. Dilute 3 ml of *phosphoric acid R* to 1000 ml with water *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 65	22	78
65 - 66	55	45
66 - 76	95	5
76 - 85	22	78

- as detector a spectrophotometer set at 200 nm.

Inject 20 µl of each solution.

Calculate the response factor of asiaticoside from the expression:

$$R_f = \frac{A_1 \times V_1 \times 100}{m_1 \times \text{HPLC}_P}$$

A_1 = area of the peak corresponding to asiaticoside in the chromatogram obtained with the reference solution,

V_1 = volume of the reference solution, in millilitres,

m_1 = mass of asiaticoside in the reference solution, in milligrams,

HPLC_P = purity determined for asiaticoside.

Calculate the mean response factor for asiaticoside from the expression:

$$\overline{R_f} = \frac{\sum_{i=1}^N R_{fi}}{N}$$

$\sum_{i=1}^N R_{fi}$ = sum of response factors of asiaticoside for the chromatograms obtained with the reference solution,

N = number of injections of reference solution ($N = 4$, at least).

Calculate the percentage content of total triterpenoid derivatives, expressed as asiaticoside from the expression:

$$\frac{V}{m} \left[\frac{A + (B \times 1.017) + (C \times 0.526) + (D \times 0.509)}{\overline{R_f}} \right]$$

V = volume of the test solution, in millilitres,

m = mass of the substance to be examined in the test solution, in milligrams,

A = area of the peak corresponding to asiaticoside in the chromatogram with the test solution,

B = area of the peak corresponding to madecassoside in the chromatogram with the test solution,

C = area of the peak corresponding to madecassic acid in the chromatogram with the test solution,

D = area of the peak corresponding to asiatic acid in the chromatogram with the test solution,

$\overline{R_f}$ = mean response factor of asiaticoside.

Relative retention with reference to the solvent:

madecassoside = about 5.8; asiaticoside = about 8.1; madecassic acid = about 17.6; asiatic acid = about 21.7.

STORAGE

Store protected from light.

01/2005:1084

CETIRIZINE DIHYDROCHLORIDE

Cetirizini dihydrochloridum

$\text{C}_{21}\text{H}_{27}\text{Cl}_3\text{N}_2\text{O}_3$

M_r 461.8

DEFINITION

(*RS*)-2-[2-[4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid dihydrochloride.

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, practically insoluble in acetone and in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 20.0 mg in 50 ml of a 10.3 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 10.3 g/l solution of *hydrochloric acid R*. Examined between 210 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 231 nm. The specific absorbance at the maximum is 359 to 381.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *cetirizine dihydrochloride CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *cetirizine dihydrochloride CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *chlorphenamine maleate CRS* in *water R* and dilute to 5 ml with the same solvent. To 1 ml of the solution add 1 ml of reference solution (a).

Plate: TLC silica gel GF₂₅₄ plate *R*.

Mobile phase: *ammonia R*, *methanol R*, *methylene chloride R* (1:10:90 V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in a current of cold air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

- the chromatogram obtained shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

pH (2.2.3): 1.2 to 1.8 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *cetirizine dihydrochloride CRS* and 5.0 mg of *cetirizine impurity A CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *silica gel for chromatography R* (5 µm).

Mobile phase: *dilute sulphuric acid R*, *water R*, *acetonitrile R* (0.4:6.6:93 V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 3 times the retention time of cetirizine.

System suitability: reference solution (a):

- **resolution:** minimum 3 between the peaks due to cetirizine and impurity A,
- **symmetry factors:** maximum 2.0.

Limits:

- **impurities A, B, C, D, E, F:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 70 ml of a mixture of 30 volumes of *water R* and 70 volumes of *acetone R*. Titrate with 0.1 M *sodium hydroxide* to the second point of inflexion. Determine the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 15.39 mg of C₂₁H₂₇Cl₃N₂O₃.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

- A. R1 = R2 = H, R3 = Cl: (RS)-1-[(4-chlorophenyl)phenylmethyl]piperazine,
- B. R1 = CH₂-CO₂H, R2 = H, R3 = Cl: (RS)-2-[4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl]acetic acid,
- C. R1 = CH₂-CH₂-O-CH₂-CO₂H, R2 = Cl, R3 = H: (RS)-2-[2-[4-[(2-chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid,
- E. R1 = CH₂-[CH₂-O-CH₂]₂-CO₂H, R2 = H, R3 = Cl: (RS)-2-[2-[2-[4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]ethoxy]acetic acid (ethoxycetirizine),
- F. R1 = CH₂-CH₂-O-CH₂-CO₂H, R2 = R3 = H: [2-[4-(diphenylmethyl)piperazin-1-yl]ethoxy]acetic acid,

- D. 1,4-bis[(4-chlorophenyl)phenylmethyl]piperazine.

01/2005:0702

CETOSTEARYL ALCOHOL

Alcohol cetylicus et stearylicus

DEFINITION

Cetostearyl alcohol is a mixture of solid aliphatic alcohols. It contains not less than 40.0 per cent of stearyl alcohol (C₁₈H₃₈O; *M_r* 270.5) and the sum of the contents of cetyl alcohol (C₁₆H₃₄O; *M_r* 242.4) and of stearyl alcohol is not less than 90.0 per cent.

CHARACTERS

White or pale yellow, wax-like mass, plates, flakes or granules, practically insoluble in water, soluble in alcohol (90 per cent *V/V*) and in light petroleum; when melted, it is miscible with fatty oils, with liquid paraffin and with melted wool fat.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The 2 principal peaks in the chromatogram obtained with the test solution have similar retention times to the principal peaks in the chromatograms obtained with reference solution (a) and reference solution (b), respectively.

TESTS

Appearance of solution. Dissolve 0.50 g in 20 ml of boiling alcohol *R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Melting point (2.2.14): 49 °C to 56 °C.

Acid value (2.5.1). Not more than 1.0.

Hydroxyl value (2.5.3, *Method A*): 208 to 228.

Iodine value (2.5.4). Not more than 2.0, determined on 2.00 g, dissolved in 25 ml of chloroform *R*.

Saponification value (2.5.6). Not more than 2.0.

ASSAY

Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.100 g of the substance to be examined in ethanol *R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 60.0 mg of cetyl alcohol CRS in ethanol *R* and dilute to 10.0 ml with the same solvent.

Reference solution (b) Dissolve 40.0 mg of stearyl alcohol CRS in ethanol *R* and dilute to 10.0 ml with the same solvent.

Reference solution (c). Mix 1 ml of reference solution (a) and 1 ml of reference solution (b) and dilute to 10.0 ml with ethanol *R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 3 m long and 4 mm in internal diameter packed with *diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of poly(dimethyl)siloxane *R*,
- nitrogen for chromatography *R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 200 °C and that of the injection port and the detector at 250 °C.

Inject separately 2 µl of each solution. Adjust the flow rate so that the resolution between the 2 principal peaks in the chromatogram obtained with the test solution is not less than 1.25. The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 principal peaks with a signal-to-noise ratio of at least 5. Determine the content of cetyl alcohol and of stearyl alcohol from the chromatogram obtained with the test solution, using the normalisation procedure and identifying the peaks by comparison with the chromatograms obtained with reference solution (a) and reference solution (b), respectively.

01/2005:0801

CETOSTEARYL ALCOHOL (TYPE A), EMULSIFYING

Alcohol cetylicus et stearylicus emulsificans A

DEFINITION

Emulsifying cetostearyl alcohol (type A) is a mixture which contains not less than 80.0 per cent of cetostearyl alcohol and not less than 7.0 per cent of sodium cetostearyl sulphate, both calculated with reference to the anhydrous substance. A suitable buffer may be added.

CHARACTERS

White or pale yellow, wax-like mass, plates, flakes or granules, soluble in hot water giving an opalescent solution, practically insoluble in cold water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C, D.

Second identification: A, C.

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution (a). Dissolve 0.1 g of the substance to be examined in 10 ml of *trimethylpentane R*, heating on a water-bath. Shake with 2 ml of *alcohol (70 per cent V/V) R* and allow to separate. Use the lower layer as test solution (b). Dilute 1 ml of the upper layer to 8 ml with *trimethylpentane R*.

Test solution (b). Use the lower layer obtained in the preparation of test solution (a).

Reference solution (a). Dissolve 40 mg of *cetostearyl alcohol R* in 10 ml of *trimethylpentane R*.

Reference solution (b). Dissolve 20 mg of *sodium cetostearyl sulphate R* in 10 ml of *alcohol (70 per cent V/V) R*, heating on a water-bath.

Apply to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *water R*, 40 volumes of *acetone R* and 40 volumes of *methanol R*. Allow the plate to dry in air and spray with a 50 g/l solution of *phosphomolybdic acid R* in *alcohol R*. Heat at 120 °C until spots appear (about 3 h). The 2 principal spots in the chromatogram obtained with test solution (a) are similar in position and colour to the principal spots in the chromatogram obtained with reference solution (a). 2 of the spots in the chromatogram obtained with test solution (b) are similar in position and colour to the principal spots in the chromatogram obtained with reference solution (b).

- B. Examine the chromatograms obtained in the assay. The retention times of the 2 principal peaks in the chromatogram obtained with test solution (b) are similar to those of the 2 principal peaks in the chromatogram obtained with the reference solution.
- C. It gives a yellow colour to a non-luminous flame.
- D. To 0.3 g add 20 ml of *ethanol R* and heat on a water-bath with shaking. Filter the mixture immediately, evaporate to dryness and take up the residue in 7 ml of *water R*. To 1 ml of the solution add 0.1 ml of a 1 g/l solution of *methylene blue R*, 2 ml of *dilute sulphuric acid R* and 2 ml of *methylene chloride R* and shake. A blue colour develops in the lower layer.

TESTS

Acid value (2.5.1). Not more than 2.0.

Iodine value (2.5.4). Not more than 3.0, determined on 2.00 g dissolved in 25 ml of *methylene chloride R*.

Saponification value (2.5.6). Not more than 2.0.

Water (2.5.12). Not more than 3.0 per cent, determined on 2.50 g by the semi-micro determination of water.

ASSAY

Cetostearyl alcohol. Examine by gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.60 g of *heptadecanol CRS* in *ethanol R* and dilute to 150 ml with the same solvent.

Test solution (a). Dissolve 0.300 g of the substance to be examined in 50 ml of the internal standard solution, add 50 ml of *water R* and shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Wash with 2 quantities, each of 30 ml, of *water R*, dry over *anhydrous sodium sulphate R* and filter.

Test solution (b). Dissolve 0.300 g of the substance to be examined in 50 ml of *ethanol R*, add 50 ml of *water R* and shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Wash with 2 quantities, each of 30 ml, of *water R*, dry over *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(dimethyl)siloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 1 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 20	150 → 250	5	linear gradient
Injection port		250		
Detector		250		

The substances are eluted in the following order: cetyl alcohol, heptadecanol (internal standard) and stearyl alcohol.

Inject 1 µl of test solution (a) and 1 µl of test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio:

$$r = \frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (b),

S_i = area of the peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a).

If r is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a):

$$S_{Ha(corr)} = S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),

S_c = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject, under the same conditions, equal volumes of the reference solution and of test solution (a). Identify the peaks in the chromatogram obtained with test solution (a) by comparing their retention times with those of the peaks in the chromatogram obtained with the reference solution and determine the area of each peak.

Calculate the percentage content of cetyl alcohol using the expression:

$$S_A \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

- S_A = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (a),
- m_H = mass of the internal standard in test solution (a), in milligrams,
- $S_{Ha(corr)}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),
- m = mass of the substance to be examined in test solution (a), in milligrams.

Calculate the percentage content of stearyl alcohol using the expression:

$$S_B \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

- S_B = area of the peak corresponding to stearyl alcohol in the chromatogram obtained with test solution (a).

The percentage content of cetostearyl alcohol corresponds to the sum of the percentage content of cetyl alcohol and of stearyl alcohol.

Sodium cetostearyl sulphate. Disperse 0.300 g in 25 ml of *methylene chloride R*. Add 50 ml of *water R* and 10 ml of *dimidium bromide-sulphan blue mixed solution R*. Titrate with 0.004 M *benzethonium chloride*, using sonication and heating and allowing the layers to separate before each addition, until the colour of the lower layer changes from pink to grey.

1 ml of 0.004 M *benzethonium chloride* is equivalent to 1.434 mg of sodium cetostearyl sulphate.

LABELLING

The label states, where applicable, the name and concentration of any added buffer.

01/2005:0802

CETOSTEARYL ALCOHOL (TYPE B), EMULSIFYING

Alcohol cetylicus et stearylicus emulsificans B

DEFINITION

Emulsifying cetostearyl alcohol (type B) is a mixture which contains not less than 80.0 per cent of cetostearyl alcohol and not less than 7.0 per cent of sodium laurilsulfate, both calculated with reference to the anhydrous substance. A suitable buffer may be added.

CHARACTERS

White or pale yellow, wax-like mass, plates, flakes or granules, soluble in hot water giving an opalescent solution, practically insoluble in cold water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C, D.

Second identification: A, C.

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution (a). Dissolve 0.1 g of the substance to be examined in 10 ml of *trimethylpentane R*, heating on a water-bath. Shake with 2 ml of *alcohol (70 per*

cent V/V) R and allow to separate. Use the lower layer as test solution (b). Dilute 1 ml of the upper layer to 8 ml with *trimethylpentane R*.

Test solution (b). Use the lower layer obtained in the preparation of test solution (a).

Reference solution (a). Dissolve 40 mg of *cetostearyl alcohol R* in 10 ml of *trimethylpentane R*.

Reference solution (b). Dissolve 20 mg of *sodium laurilsulfate R* in 10 ml of *alcohol (70 per cent V/V) R*, heating on a water-bath.

Apply to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *water R*, 40 volumes of *acetone R* and 40 volumes of *methanol R*. Allow the plate to dry in air and spray with a 50 g/l solution of *phosphomolybdic acid R* in *alcohol R*. Heat at 120 °C until spots appear (about 3 h). The 2 principal spots in the chromatogram obtained with test solution (a) are similar in position and colour to the principal spots in the chromatogram obtained with reference solution (a). 1 of the spots in the chromatogram obtained with test solution (b) is similar in position and colour to the principal spot in the chromatogram obtained with reference solution (b).

- B. Examine the chromatograms obtained in the assay. The retention times of the 2 principal peaks in the chromatogram obtained with test solution (b) are similar to those of the 2 principal peaks in the chromatogram obtained with the reference solution.
- C. It gives a yellow colour to a non-luminous flame.
- D. To 0.3 g add 20 ml of *ethanol R* and heat to boiling on a water-bath with shaking. Filter the mixture immediately, evaporate to dryness and take up the residue in 7 ml of *water R*. To 1 ml of the solution add 0.1 ml of a 1 g/l solution of *methylene blue R*, 2 ml of *dilute sulphuric acid R* and 2 ml of *methylene chloride R* and shake. A blue colour develops in the lower layer.

TESTS

Acid value (2.5.1). Not more than 2.0.

Iodine value (2.5.4). Not more than 3.0, determined on 2.00 g dissolved in 25 ml of *methylene chloride R*.

Saponification value (2.5.6). Not more than 2.0.

Water (2.5.12). Not more than 3.0 per cent, determined on 2.50 g by the semi-micro determination of water.

ASSAY

Cetostearyl alcohol. Examine by gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.60 g of *heptadecanol CRS* in *ethanol R* and dilute to 150 ml with the same solvent.

Test solution (a). Dissolve 0.300 g of the substance to be examined in 50 ml of the internal standard solution, add 50 ml of *water R* and shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Wash with 2 quantities, each of 30 ml, of *water R*, dry over *anhydrous sodium sulphate R* and filter.

Test solution (b). Dissolve 0.300 g of the substance to be examined in 50 ml of *ethanol R*, add 50 ml of *water R* and shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Wash with 2 quantities, each of 30 ml, of *water R*, dry over *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(dimethyl)siloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 1 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 20	150 → 250	5	linear gradient
Injection port		250		
Detector		250		

The substances are eluted in the following order: cetyl alcohol, heptadecanol (internal standard) and stearyl alcohol.

Inject 1 µl of test solution (a) and 1 µl of test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio:

$$r = \frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (b),

S_i = area of the peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a).

If r is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a):

$$S_{Ha(corr)} = S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),

S_c = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject, under the same conditions, equal volumes of the reference solution and of test solution (a). Identify the peaks in the chromatogram obtained with test solution (a) by comparing their retention times with those of the peaks in the chromatogram obtained with the reference solution and determine the area of each peak.

Calculate the percentage content of cetyl alcohol using the expression:

$$S_A \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_A = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (a),

m_H = mass of the internal standard in test solution (a), in milligrams,

$S_{Ha(corr)}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),

m = mass of the substance to be examined in test solution (a), in milligrams.

Calculate the percentage content of stearyl alcohol using the expression:

$$S_B \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_B = area of the peak corresponding to stearyl alcohol in the chromatogram obtained with test solution (a).

The percentage content of cetostearyl alcohol corresponds to the sum of the percentage content of cetyl alcohol and of stearyl alcohol.

Sodium laurilsulfate. Disperse 0.300 g in 25 ml of *methylene chloride R*. Add 50 ml of *water R* and 10 ml of *dimidium bromide-sulphan blue mixed solution R*. Titrate with 0.004 M *benzethonium chloride*, using sonication and heating, and allowing the layers to separate before each addition, until the colour of the lower layer changes from pink to grey.

1 ml of 0.004 M *benzethonium chloride* is equivalent to 1.154 mg of sodium laurilsulfate.

LABELLING

The label states, where applicable, the name and concentration of any added buffer.

01/2005:1085

CETOSTEARYL ISONONANOATE

Cetostearyl isononanoas

DEFINITION

Cetostearyl isononanoate is a mixture of esters of cetostearyl alcohol with isononanoic acid, mainly 3,5,5-trimethylhexanoic acid.

CHARACTERS

A clear, colourless or slightly yellowish liquid, practically insoluble in water, soluble in alcohol and in light petroleum, miscible with fatty oils and with liquid paraffins.

It has a viscosity of 15 mPas to 30 mPas, a relative density of 0.85 to 0.86 and a refractive index of 1.44 to 1.45.

IDENTIFICATION

- On cooling, turbidity occurs below 15 °C.
- It complies with the test for saponification value (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of cetostearyl isononanoate*.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method I).

Acid value (2.5.1). Not more than 1.0, determined on 5.0 g.

Hydroxyl value (2.5.3, Method A). Not more than 5.0.

Iodine value (2.5.4). Not more than 1.0.

Saponification value (2.5.6): 135 to 148, determined on 1.0 g.

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12). Not more than 0.2 per cent, determined on 10.0 g by the semi-micro determination of water.

Total ash (2.4.16). Not more than 0.2 per cent, determined on 2.0 g.

01/2005:0378

CETRIMIDE

Cetrimidum

DEFINITION

Cetrimide consists of trimethyltetradecylammonium bromide and may contain smaller amounts of dodecyl- and hexadecyl-trimethylammonium bromides.

Content: 96.0 per cent to 101.0 per cent of alkyltrimethylammonium bromides, calculated as $\text{C}_{17}\text{H}_{38}\text{BrN}$ (M_r 336.4) (dried substance).

CHARACTERS

Appearance: white or almost white, voluminous, free-flowing powder.

Solubility: freely soluble in water and in alcohol.

IDENTIFICATION

- Dissolve 0.25 g in *alcohol* R and dilute to 25.0 ml with the same solvent. At wavelengths from 260 nm to 280 nm, the absorbance (2.2.25) of the solution has a maximum of 0.05.
- Dissolve about 5 mg in 5 ml of *buffer solution pH 8.0* R. Add about 10 mg of *potassium ferricyanide* R. A yellow precipitate is formed. Prepare a blank in the same manner but omitting the substance to be examined: a yellow solution is observed but no precipitate is formed.
- Solution S (see Tests) froths copiously when shaken.
- Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.10 g of the substance to be examined in *water* R and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *trimethyltetradecylammonium bromide CRS* in *water* R and dilute to 5 ml with the same solvent.

Plate: TLC silica gel F_{254} silanised plate R.

Mobile phase: *acetone* R, 270 g/l solution of *sodium acetate* R, *methanol* R (20:35:45 V/V/V).

Application: 1 µl.

Development: over a path of 12 cm.

Drying: in a current of hot air.

Detection: allow to cool; expose the plate to iodine vapour and examine in daylight.

Result: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- It gives reaction (a) of bromides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water* R and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.1 ml of *bromocresol purple solution* R. Not more than 0.1 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Amines and amine salts. Dissolve 5.0 g in 30 ml of a mixture of 1 volume of 1 M *hydrochloric acid* and 99 volumes of *methanol* R and add 100 ml of 2-propanol R. Pass a stream of *nitrogen* R slowly through the solution. Gradually add 15.0 ml of 0.1 M *tetrabutylammonium hydroxide* and record the potentiometric titration curve (2.2.20). If the curve shows 2 points of inflexion, the volume of titrant added between the 2 points is not greater than 2.0 ml.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Dissolve 2.000 g in *water* R and dilute to 100.0 ml with the same solvent. Transfer 25.0 ml of the solution to a separating funnel, add 25 ml of *chloroform* R, 10 ml of 0.1 M *sodium hydroxide* and 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide* R. Shake, allow to separate and discard the chloroform layer. Shake the aqueous layer with 3 quantities, each of 10 ml, of *chloroform* R and discard the chloroform layers. Add 40 ml of *hydrochloric acid* R, allow to cool and titrate with 0.05 M *potassium iodate* until the deep brown colour is almost discharged. Add 2 ml of *chloroform* R and continue the titration, shaking vigorously, until the colour of the chloroform layer no longer changes. Carry out a blank titration on a mixture of 10.0 ml of the freshly prepared 50 g/l solution of *potassium iodide* R, 20 ml of *water* R and 40 ml of *hydrochloric acid* R.

1 ml of 0.05 M *potassium iodate* is equivalent to 33.64 mg of $\text{C}_{17}\text{H}_{38}\text{BrN}$.

01/2005:0540

CETYL ALCOHOL

Alcohol cetylicus

DEFINITION

Cetyl alcohol is a mixture of solid alcohols consisting mainly of hexadecanol ($\text{CH}_3(\text{CH}_2)_{14}\text{CH}_2\text{OH}$; M_r 242.4).

CHARACTERS

White, unctuous mass, powder, flakes or granules, practically insoluble in water, freely to sparingly soluble in alcohol; when melted, it is miscible with vegetable and animal oils, with liquid paraffin and with melted wool fat.

IDENTIFICATION

- Melting point (2.2.14): 46 °C to 52 °C.
- Hydroxyl value (2.5.3, *Method A*): 218 to 238.

TESTS

Appearance of solution. Dissolve 0.5 g in boiling *alcohol* R, allow to cool and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Acid value (2.5.1). Not more than 1.0.

Iodine value (2.5.4). Not more than 2.0, determined on 2.00 g dissolved in 25 ml of *chloroform R*.

Saponification value (2.5.6). Not more than 2.0.

01/2005:1906

CETYL PALMITATE

Cetyl palmitas

DEFINITION

Mixture of C₁₄-C₁₈ esters of lauric, myristic, palmitic and stearic acids ("Cetyl esters wax").

Content (expressed as hexadecyl hexadecanoate): 10.0 per cent to 20.0 per cent for Cetyl palmitate 15, 60.0 per cent to 70.0 per cent for Cetyl palmitate 65 and not less than 90.0 per cent for Cetyl palmitate 95.

CHARACTERS

Appearance: white, waxy plates, flakes or powder.

Solubility: practically insoluble in water, soluble in boiling ethanol and in methylene chloride, slightly soluble in light petroleum, practically insoluble in ethanol.

mp: about 45 °C for Cetyl palmitate 15 and Cetyl palmitate 65 and about 52 °C for Cetyl palmitate 95.

IDENTIFICATION

- It complies with the limits of the assay and the chromatogram obtained with the test solution shows the typical main peak(s).
- It complies with the test for saponification value (see Tests).

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Dissolve 4.0 g in *methylene chloride R* and dilute to 20 ml with the same solvent.

Acid value (2.5.1): maximum 4.0.

Dissolve 10.0 g in 50 ml of the solvent mixture described by heating under reflux on a water-bath for 5 min.

Hydroxyl value (2.5.3, *Method A*): maximum 20.0.

Iodine value (2.5.4): maximum 2.0.

Saponification value (2.5.6): 105 to 120.

Heat under reflux for 2 h.

Alkaline impurities. Dissolve with gentle heating 2.0 g in a mixture of 1.5 ml of *alcohol R* and 3 ml of *toluene R*. Add 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the solution to yellow.

Nickel (2.4.27): maximum 1 ppm.

Water (2.5.12): maximum 0.3 per cent, determined on 1.0 g using a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R* as solvent.

Total ash (2.4.16): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 20.0 mg of the substance to be examined in *hexane R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 20.0 mg of *cetyl palmitate 95 CRS* in *hexane R* and dilute to 20.0 ml with the same solvent.

Reference solution (b). Dissolve 20.0 mg of *cetyl palmitate 15 CRS* in *hexane R* and dilute to 20.0 ml with the same solvent.

Column:

- **material:** stainless steel,
- **size:** *l* = 10 m, Ø = 0.53 mm,
- **stationary phase:** *poly(dimethyl)siloxane R* (film thickness: 2.65 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 6.5 ml/min.

Split ratio: 1:10.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	100 → 300
	10 - 15	300
Injection port		350
Detector		350

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to cetyl palmitate (retention time = about 9 min): cetyl alcohol = about 0.3; palmitic acid = about 0.4; lauric ester = about 0.8; myristic ester = about 0.9; stearic ester = about 1.1.

System suitability: reference solution (b):

- **resolution:** minimum of 1.5 between the peaks due to cetyl palmitate and cetyl stearate.

STORAGE

At a temperature not exceeding 25 °C.

LABELLING

The label states the type of cetyl palmitate.

01/2005:0379

CETYL PYRIDINIUM CHLORIDE

Cetylpyridinii chloridum

C₂₁H₃₈ClN, H₂OM_r 358.0

DEFINITION

Cetylpyridinium chloride contains not less than 96.0 per cent and not more than the equivalent of 101.0 per cent of 1-hexadecylpyridinium chloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white powder, slightly soapy to the touch, soluble in water and in alcohol. An aqueous solution froths copiously when shaken.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 0.10 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. Examined between 240 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 259 nm and 2 shoulders at about 254 nm and at about 265 nm. The specific absorbance at the maximum is 126 to 134, calculated with reference to the anhydrous substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cetylpyridinium chloride CRS*. Examine the substances in the solid state.

C. To 5 ml of *dilute sodium hydroxide solution R* add 0.1 ml of *bromophenol blue solution R1* and 5 ml of *chloroform R* and shake. The chloroform layer is colourless. Add 0.1 ml of solution S (see Tests) and shake. The chloroform layer becomes blue.

D. Solution S gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Acidity. To 50 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 2.5 ml of 0.02 M *sodium hydroxide* is required to change the colour of the indicator.

Amines and amine salts. Dissolve 5.0 g with heating in 20 ml of a mixture of 3 volumes of 1 M *hydrochloric acid* and 97 volumes of *methanol R* and add 100 ml of 2-propanol *R*. Pass a stream of *nitrogen R* slowly through the solution. Gradually add 12.0 ml of 0.1 M *tetrabutylammonium hydroxide* and record the potentiometric titration curve (2.2.20). If the curve shows 2 points of inflexion, the volume of titrant added between the two points is not greater than 5.0 ml. If the curve shows no point of inflexion, the substance to be examined does not comply with the test. If the curve shows one point of inflexion, repeat the test but add 3.0 ml of a 25.0 g/l solution of *dimethyldodecylamine R* in 2-propanol *R* before the titration. If the titration curve after the addition of 12.0 ml of the titrant shows only one point of inflexion, the substance to be examined does not comply with the test.

Water (2.5.12): 4.5 per cent to 5.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 2.00 g in *water R* and dilute to 100.0 ml with the same solvent. Transfer 25.0 ml of the solution to a separating funnel, add 25 ml of *chloroform R*, 10 ml of 0.1 M *sodium hydroxide* and 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide R*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous layer with three quantities, each of 10 ml, of *chloroform R* and discard the chloroform layers. To the aqueous layer add 40 ml of *hydrochloric acid R*, allow to cool and titrate with 0.05 M *potassium iodate* until the deep-brown colour is almost discharged. Add 2 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer no longer changes colour. Carry out a blank titration on a mixture of 10.0 ml of the freshly prepared 50 g/l solution of *potassium iodide R*, 20 ml of *water R* and 40 ml of *hydrochloric acid R*.

1 ml of 0.05 M *potassium iodate* is equivalent to 34.0 mg of $C_{21}H_{38}ClN$.

01/2005:0380

CHAMOMILE FLOWER, ROMAN

Chamomillae romanae flos

DEFINITION

Roman chamomile flower consists of the dried flower-heads of the cultivated double variety of *Chamaemelum nobile* (L.) All. (*Anthemis nobilis* L.). It contains not less than 7 ml/kg of essential oil.

CHARACTERS

It consists of flower-heads with a white to yellowish-grey colour, being composed of solitary hemispherical capitula, made up of a solid conical receptacle bearing the florets, each subtended by a transparent small palea.

It has a strong and characteristic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The capitula have a diameter of 8 mm to 20 mm; the receptacle is solid; the base of the receptacle is surrounded by an involucre consisting of 2 or 3 rows of compact and imbricated bracts with scarious margins. Most florets are ligulate, but a few pale yellow tubular florets occur in the central region. Ligulate florets are white, dull, lanceolate and reflexed with a dark brown, inferior ovary, a filiform style and a bifid stigma; tubular florets have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoeceum similar to that of the ligulate florets.
- Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R*. All parts of the flower-heads are covered with numerous small yellow glistening glandular trichomes. The involucre bracts and paleae have epidermal cells in longitudinal rows, sclerified at the base and they are covered with conical trichomes, about 500 µm long, each composed of 3 or 4 very short base cells and a long, bent, terminal cell about 20 µm wide. The corolla of the ligulate flowers consists of papillary cells with cuticular striations. The ovaries of both kinds of florets have at their base a sclerous ring consisting of a single row of cells. The receptacle and the ovaries contain small clusters of calcium oxalate. The pollen grains have a diameter of about 35 µm and are rounded and triangular with 3 germinal pores and a spiny exine.
- Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.
Test solution. To 0.5 g of the powdered drug (710) add 10 ml of *methanol R* and heat with shaking in a water-bath at 60 °C for 5 min. Allow to cool and filter.
Reference solution. Dissolve 2.5 mg of *apigenin R* and 2.5 mg of *apigenin-7-glucoside R* in 10 ml of *methanol R*. Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 17 volumes of *glacial acetic acid R*, 17 volumes of *water R* and 66 volumes of *butanol R*. Dry the plate at 100-105 °C for 5 min and spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, using about 10 ml for a plate 200 mm square. Spray the plate with the same volume of a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to stand for about

30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the upper third a zone of yellowish-green fluorescence (apigenin) and in the middle third a zone of yellowish fluorescence (apigenin-7-glucoside). The chromatogram obtained with the test solution shows a zone of yellowish-green fluorescence corresponding in position and fluorescence to the zone due to apigenin and a zone of yellowish fluorescence corresponding in position and fluorescence to the zone due to apigenin-7-glucoside in the chromatogram obtained with the reference solution; above the apigenin-7-glucoside zone there is a zone of brownish fluorescence (luteolin); immediately below the apigenin-7-glucoside zone there is a zone of light brownish fluorescence (apiin); immediately below the apiin zone there is a zone of bright blue fluorescence and below this zone a zone of bright blue fluorescence; other faint zones may be present.

TESTS

Diameter of the flower-heads. Not more than 3 per cent of flower-heads have a diameter smaller than 8 mm.

Deteriorated flower-heads. Brown or darkened flower-heads are absent.

Loss on drying (2.2.32): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 8.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 20.0 g of whole drug, a 500 ml round-bottomed flask, 250 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-3.5 ml/min for 3 h.

STORAGE

Store protected from light.

01/2005:0313

CHARCOAL, ACTIVATED

Carbo activatus

DEFINITION

Activated charcoal is obtained from vegetable matter by suitable carbonisation processes intended to confer a high adsorption power.

CHARACTERS

A black, light powder free from grittiness, practically insoluble in all usual solvents.

IDENTIFICATION

- A. When heated to redness it burns slowly without a flame.
- B. It complies with the test for adsorption power (see Tests).

TESTS

Solution S. To 2.0 g in a conical flask with a ground-glass neck add 50 ml of *dilute hydrochloric acid R*. Boil gently under a reflux condenser for 1 h, filter and wash the filter with *dilute hydrochloric acid R*. Evaporate the combined filtrate and washings to dryness on a water-bath, dissolve the residue in 0.1 M *hydrochloric acid* and dilute to 50.0 ml with the same acid.

Acidity or alkalinity. To 2.0 g add 40 ml of *water R* and boil for 5 min. Cool, restore to the original mass with *carbon dioxide-free water R* and filter. Reject the first 20 ml of the filtrate. To 10 ml of the filtrate add 0.25 ml of *bromothymol blue solution R1* and 0.25 ml of 0.02 M *sodium hydroxide*. The solution is blue. Not more than 0.75 ml of 0.02 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid-soluble substances. To 1.0 g add 25 ml of *dilute nitric acid R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (10) and wash with 10 ml of hot *water R*. Evaporate the combined filtrate and washings to dryness on a water-bath, add to the residue 1 ml of *hydrochloric acid R*, evaporate to dryness again and dry the residue to constant mass at 100 °C to 105 °C. The residue weighs not more than 30 mg (3 per cent).

Alkali-soluble coloured substances. To 0.25 g add 10 ml of *dilute sodium hydroxide solution R* and boil for 1 min. Cool, filter and dilute the filtrate to 10 ml with *water R*. The solution is not more intensely coloured than reference solution GY₄ (2.2.2, *Method II*).

Alcohol-soluble substances. To 2.0 g add 50 ml of *alcohol R* and boil under a reflux condenser for 10 min. Filter immediately, cool, and dilute to 50 ml with *alcohol R*. The filtrate is not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, *Method II*). Evaporate 40 ml of the filtrate to dryness and dry to constant mass at 100 °C to 105 °C. The residue weighs not more than 8 mg (0.5 per cent).

Fluorescent substances. In an intermittent-extraction apparatus, treat 10.0 g with 100 ml of *cyclohexane R1* for 2 h. Collect the liquid and dilute to 100 ml with *cyclohexane R1*. Examine in ultraviolet light at 365 nm. The fluorescence of the solution is not more intense than that of a solution of 83 µg of *quinine R* in 1000 ml of 0.005 M *sulphuric acid* examined in the same manner.

Sulphides. To 1.0 g in a conical flask add 5 ml of *hydrochloric acid R1* and 20 ml of *water R*. Heat to boiling. The fumes released do not turn *lead acetate paper R* brown.

Copper. Not more than 25 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R* and diluting with 0.1 M *hydrochloric acid*.

Measure the absorbance at 325.0 nm using a copper hollow-cathode lamp as source of radiation and an air-acetylene flame.

Lead. Not more than 10 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the reference solutions using *lead standard solution (100 ppm Pb) R* and diluting with 0.1 M *hydrochloric acid*.

Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame. Depending on the apparatus the line at 217.0 nm may be used.

Zinc. Not more than 25 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R* and diluting with 0.1 M *hydrochloric acid*.

Measure the absorbance at 214.0 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 15 per cent, determined on 1.00 g by drying in an oven at 120 °C for 4 h.

Sulphated ash (2.4.14). Not more than 5.0 per cent, determined on 1.0 g.

Adsorption power. To 0.300 g in a 100 ml ground-glass-stoppered conical flask add 25.0 ml of a freshly prepared solution of 0.5 g of *phenazone R* in 50 ml of *water R*. Shake thoroughly for 15 min. Filter and reject the first 5 ml of filtrate. To 10.0 ml of the filtrate add 1.0 g of *potassium bromide R* and 20 ml of *dilute hydrochloric acid R*. Using 0.1 ml of *methyl red solution R* as indicator, titrate with 0.0167 M *potassium bromate* until the red colour is discharged. Titrate slowly (1 drop every 15 s) towards the end of the titration. Carry out a blank titration using 10.0 ml of the phenazone solution.

Calculate the quantity of phenazone adsorbed per 100 g of activated charcoal from the expression:

$$\frac{2.353(a - b)}{m}$$

a = number of millilitres of 0.0167 M *potassium bromate* used for the blank,

b = number of millilitres of 0.0167 M *potassium bromate* used for the test,

m = mass in grams of the substance to be examined.

Not less than 40 g of phenazone is adsorbed per 100 g of activated charcoal, calculated with reference to the dried substance.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate count.

STORAGE

Store in an airtight container.

01/2005:1189

CHENODEOXYCHOLIC ACID

Acidum chenodeoxycholicum

C₂₄H₄₀O₄

*M*_r 392.6

DEFINITION

Chenodeoxycholic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3α,7α-dihydroxy-5β-cholan-24-oic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, freely soluble in alcohol, soluble in acetone, slightly soluble in methylene chloride.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chenodeoxycholic acid CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 10 mg in 1 ml of *sulphuric acid R*. Add 0.1 ml of *formaldehyde solution R* and allow to stand for 5 min. Add 5 ml of *water R*. The suspension obtained is greenish-blue.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.500 g in *methanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 11.0 to + 13.0, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (a). Dissolve 40 mg of *chenodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *lithocholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents. Dilute 2 ml of the solution to 100 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (c). Dissolve 20 mg of *ursodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (d). Dissolve 20 mg of *cholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (e). Dilute 0.5 ml of test solution (a) to 20 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (f). Dissolve 10 mg of *chenodeoxycholic acid CRS* in reference solution (c) and dilute to 25 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *acetone R* and 60 volumes of *methylene chloride R*. Dry the plate at 120 °C for 10 min. Spray the plate immediately with a 47.6 g/l solution of *phosphomolybdic acid R* in a mixture of 1 volume of *sulphuric acid R* and 20 volumes of *glacial acetic acid R* and heat again at 120 °C until blue spots appear on a lighter background. In the chromatogram obtained with test solution (a): any spot corresponding to lithocholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (b).

(0.1 per cent); any spot corresponding to ursodeoxycholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (1 per cent); any spot corresponding to cholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.5 per cent); any spot apart from the principal spot and any spots corresponding to lithocholic acid, ursodeoxycholic acid and cholic acid, is not more intense than the principal spot in the chromatogram obtained with reference solution (e) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (f) shows two clearly separated principal spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *alcohol* R, previously neutralised to 0.2 ml of *phenolphthalein solution* R. Add 50 ml of *water* R and titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 39.26 mg of C₂₄H₄₀O₄.

IMPURITIES

- A. R = H, R₁ = OH, R₂ = H, R₃ = H: ursodeoxycholic acid,
- B. R = H, R₁ = H, R₂ = OH, R₃ = OH: 3 α ,7 α ,12 α -trihydroxy-5 β -cholan-24-oic acid (cholic acid),
- C. R = H, R₁ = H, R₂ = H, R₃ = H: 3 α -hydroxy-5 β -cholan-24-oic acid (lithocholic acid),
- D. R = H, R₁ = OH, R₂ = H, R₃ = OH: 3 α ,7 β ,12 α -trihydroxy-5 β -cholan-24-oic acid (ursocholic acid),
- E. R = H, R₁ = H, R₂ = H, R₃ = OH: 3 α ,12 α -dihydroxy-5 β -cholan-24-oic acid (deoxycholic acid),
- F. R = H, R₁+R₂ = O, R₃ = H: 3 α -hydroxy-7-oxo-5 β -cholan-24-oic acid,
- G. R = CH₃, R₁ = OH, R₂ = H, R₃ = H: methyl 3 α ,7 β -dihydroxy-5 β -cholan-24-oate.

01/2005:1774

CHITOSAN HYDROCHLORIDE

Chitosani hydrochloridum

DEFINITION

Chitosan hydrochloride is the chloride salt of an unbranched binary heteropolysaccharide consisting of the two units *N*-acetyl-D-glucosamine and D-glucosamine, obtained by

partial deacetylation of chitin normally leading to a degree of deacetylation of 70.0 per cent to 95.0 per cent. Chitin is extracted from the shells of shrimp and crab.

PRODUCTION

The animals from which chitosan hydrochloride is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority. It must have been shown to what extent the method of production allows inactivation or removal of any contamination by viruses or other infectious agents.

CHARACTERS

Appearance: white or almost white fine powder.

Solubility: sparingly soluble in water, practically insoluble in ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: chitosan hydrochloride CRS.

B. It gives reaction (a) of chlorides (2.3.1).

C. Dilute 50 ml of solution S (see Tests) to 250 ml with a 25 per cent V/V solution of *ammonia* R. A voluminous gelatinous mass is formed.

D. To 10 ml of solution S add 90 ml of *acetone* R. A voluminous gelatinous mass is formed.

TESTS

Solution S. Dissolve 1.0 g in 100 ml of *water* R and stir vigorously for 20 min with a mechanical stirrer.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Matter insoluble in water: maximum 0.5 per cent.

Add 2.00 g to 400.0 ml of *water* R while stirring until no further dissolution takes place. Transfer the solution to a 2 litre beaker, add 200 ml of *water* R. Boil the solution gently for 2 h, covering the beaker during the operation. Filter through a sintered-glass filter (40) wash the residue with water and dry to constant weight in an oven at 100-105 °C. The residue weighs a maximum of 10 mg.

pH (2.2.3): 4.0 to 6.0 for solution S.

Viscosity (2.2.10): 80 per cent to 120 per cent of the value stated on the label, determined on solution S.

Determine the viscosity using a rotating viscometer at 20 °C with a spindle rotating at 20 r/min, using a suitable spindle for the range of the expected viscosity.

Degree of deacetylation

Test solution. Dissolve 0.250 g in *water* R and dilute to 50.0 ml with the same solvent stirring vigorously. Dilute 1.0 ml of the solution to 100.0 ml with *water* R. Measure the absorbance (2.2.25) from 200 nm to 205 nm as the first derivative of the absorbance curve. Determine the pH of the solution.

Reference solutions. Prepare solutions of 1.0 µg/ml, 5.0 µg/ml, 15.0 µg/ml and 35.0 µg/ml of *N*-acetylglucosamine R in *water* R. Measure the absorbance (2.2.25) from 200 nm to 205 nm of each solution as first derivative of the absorption curve. Make a standard curve by plotting the first derivative at 202 nm as a function of the concentration of *N*-acetylglucosamine, and calculate the slope of the curve by least squares linear regression. Use the standard curve to determine the equivalent amount of *N*-acetylglucosamine for the substance to be examined.

Calculate the degree of deacetylation (molar) using the expression:

$$\frac{100 \times M_1 \times (C_1 - C_2)}{(M_1 \times C_1) - [(M_1 - M_3) \times C_2]}$$

- C_1 = concentration of chitosan hydrochloride in the test solution in micrograms per millilitre,
 C_2 = concentration of *N*-acetylglucosamine in the test solution, as determined from the standard curve prepared using the reference solution in micrograms per millilitre,
 M_1 = 203 (relative molecular mass of *N*-acetylglucosamine unit ($C_8H_{13}NO_5$) in polymer),
 M_3 = relative molecular mass of chitosan hydrochloride.

M_3 is calculated from the pH in solution, assuming a pK_a value of 6.8, using the following expressions:

$$M_3 = f \times M_2 + (1 - f) \times (M_2 + 36.5)$$

$$f = \frac{p}{1 + p}$$

$$p = 10^{(pH - pK_a)}$$

- M_2 = 161 (relative molecular mass of deacetylated unit (glucosamine) ($C_6H_{11}NO_4$) in polymer).

Chlorides: 10.0 per cent to 20.0 per cent.

Introduce 0.200 g into a 250 ml borosilicate flask fitted with a reflux condenser. Add 40 ml of a mixture of 1 volume of *nitric acid R* and 2 volumes of *water R*. Boil gently under a reflux condenser for 5 min. Cool and add 25 ml of *water R* through the condenser. Add 16.0 ml of 0.1 M *silver nitrate*, shake vigorously and titrate with 0.1 M *ammonium thiocyanate*, using 1 ml of *ferric ammonium sulphate solution R2* as indicator, and shaking vigorously towards the end-point. Carry out a blank titration.

1 ml of 0.1 M *silver nitrate* is equivalent to 3.55 mg of Cl.

Heavy metals (2.4.8): maximum 40 ppm.

1.0 g complies with limit test F. Prepare the standard using 4 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 10 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

STORAGE

At a temperature of 2–8 °C, protected from moisture and light.

LABELLING

The label states the nominal viscosity in millipascal seconds for a 10 g/l solution in *water R*.

CHLORAL HYDRATE

Chlorali hydras

DEFINITION

Chloral hydrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2,2,2-trichloroethane-1,1-diol.

CHARACTERS

Colourless, transparent crystals, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- A. To 10 ml of solution S (see Tests) add 2 ml of *dilute sodium hydroxide solution R*. The mixture becomes cloudy and, when heated, gives off an odour of chloroform.
 B. To 1 ml of solution S add 2 ml of *sodium sulphide solution R*. A yellow colour develops which quickly becomes reddish-brown. On standing for a short time, a red precipitate may be formed.

TESTS

Solution S. Dissolve 3.0 g in *carbon dioxide-free water R* and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.5 to 5.5.

Chloral alcoholate. Warm 1.0 g with 10 ml of *dilute sodium hydroxide solution R*, filter the supernatant solution and add 0.05 M *iodine* dropwise until a yellow colour is obtained. Allow to stand for 1 h. No precipitate is formed.

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (100 ppm).

Heavy metals (2.4.8). 10 ml of solution S diluted to 20 ml with *water R* complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Non-volatile residue. Evaporate 2.000 g on a water-bath. The residue weighs not more than 2 mg (0.1 per cent).

ASSAY

Dissolve 4.000 g in 10 ml of *water R* and add 40.0 ml of 1 M *sodium hydroxide*. Allow to stand for exactly 2 min and titrate with 0.5 M *sulphuric acid*, using 0.1 ml of *phenolphthalein solution R* as indicator. Titrate the neutralised solution with 0.1 M *silver nitrate*, using 0.2 ml of *potassium chromate solution R* as indicator. Calculate the number of millilitres of 1 M *sodium hydroxide* used by deducting from the volume of 1 M *sodium hydroxide*, added at the beginning of the titration, the volume of 0.5 M *sulphuric acid* used in the first titration and two-fifteenths of the volume of 0.1 M *silver nitrate* used in the second titration.

1 ml of 1 M *sodium hydroxide* is equivalent to 0.1654 g of $C_2H_3Cl_3O_2$.

STORAGE

Store in an airtight container.

01/2005:0137

CHLORAMBUCIL

Chlorambucilum

 $C_{14}H_{19}Cl_2NO_2$ M_r 304.2**DEFINITION**

Chlorambucil contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-4-[di(2-chloroethyl)amino]phenylbutyric acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, freely soluble in acetone and in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 64 °C to 67 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorambucil CRS*.
- C. To 0.4 g add 10 ml of *dilute hydrochloric acid R*, mix and allow to stand for 30 min, shaking from time to time. Filter and wash the precipitate with 2 quantities, each of 10 ml, of *water R*. To 10 ml of the combined filtrate and washings add 0.5 ml of *potassium tetraiodomercurate solution R*. A pale-brown precipitate is formed. To another 10 ml of the combined filtrate and washings add 0.2 ml of *potassium permanganate solution R*. The colour of the latter is discharged immediately.
- D. Dissolve 50 mg in 5 ml of *acetone R* and dilute to 10 ml with *water R*. Add 0.05 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. No opalescence is produced immediately. Heat the solution on a water-bath; an opalescence develops.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Carry out all operations as rapidly as possible protected from light. Prepare the solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 50 ml with *acetone R*.

Reference solution (b). Dilute 25 ml of reference solution (a) to 100 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *methyl ethyl ketone R*, 20 volumes of *heptane R*, 25 volumes of *methanol R* and 40 volumes of *toluene R*. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (2.0 per cent) and

at most 1 such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Water (2.5.12). Not more than 0.5 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 10 ml of *acetone R* and add 10 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, using 0.1 ml of *phenolphthalein solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 30.42 mg of $C_{14}H_{19}Cl_2NO_2$.

STORAGE

Store protected from light.

01/2005:0071

CHLORAMPHENICOL

Chloramphenicolum

 $C_{11}H_{12}Cl_2N_2O_5$ M_r 323.1**DEFINITION**

Chloramphenicol is 2,2-dichloro-*N*-(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)-2-(4-nitrophenyl)ethyl]acetamide, produced by the growth of certain strains of *Streptomyces venezuelae* in a suitable medium. It is normally prepared by synthesis. It contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of $C_{11}H_{12}Cl_2N_2O_5$, calculated with reference to the dried substance.

CHARACTERS

A white, greyish-white or yellowish-white, fine, crystalline powder or fine crystals, needles or elongated plates, slightly soluble in water, freely soluble in alcohol and in propylene glycol.

A solution in ethanol is dextrorotatory and a solution in ethyl acetate is laevorotatory.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 149 °C to 153 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chloramphenicol CRS*.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with 1 µl of the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 1 ml of *alcohol (50 per cent V/V) R*, add 3 ml of a 10 g/l solution of *calcium chloride R* and 50 mg of *zinc powder R* and heat on a water-bath for 10 min. Filter the hot solution and allow to cool. Add 0.1 ml of *benzoyl chloride R* and shake for

1 min. Add 0.5 ml of *ferric chloride solution R1* and 2 ml of *chloroform R* and shake. The aqueous layer is coloured light violet-red to purple.

- E. To 50 mg in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Acidity or alkalinity. To 0.1 g add 20 ml of *carbon dioxide-free water R*, shake and add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of 0.02 M *hydrochloric acid* or 0.02 M *sodium hydroxide* is required to change the colour of the indicator.

Specific optical rotation (2.2.7). Dissolve 1.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 18.5 to + 20.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 0.10 g of *chloramphenicol CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 100 ml with *acetone R*.

Apply separately to the plate 1 µl and 20 µl of the test solution, 1 µl of reference solution (a) and 20 µl of reference solution (b). Develop over a path of 15 cm using a mixture of 1 volume of *water R*, 10 volumes of *methanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with 20 µl of the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (2.4.4). To 1.00 g add 20 ml of *water R* and 10 ml of *nitric acid R* and shake for 5 min. Filter through a filter paper previously washed by filtering 5 ml portions of *water R* until 5 ml of filtrate no longer becomes opalescent on addition of 0.1 ml of *nitric acid R* and 0.1 ml of *silver nitrate solution R1*. 15 ml of the filtrate complies with the limit test for chlorides (100 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

Pyrogens (2.6.8). If intended for use in the manufacture of a parenteral dosage form without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 2.5 ml of a solution containing per millilitre 2 mg of the substance to be examined.

ASSAY

Dissolve 0.100 g in *water R* and dilute to 500.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 278 nm.

Calculate the content of $C_{27}H_{42}Cl_2N_2O_6$ taking the specific absorbance to be 297.

STORAGE

Store protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

01/2005:0473

CHLORAMPHENICOL PALMITATE

Chloramphenicoli palmitas

 $C_{27}H_{42}Cl_2N_2O_6$
 M_r 561.6

DEFINITION

Chloramphenicol palmitate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*,3*R*)-2-[(dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propyl hexadecanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, fine, unctuous powder, practically insoluble in water, freely soluble in acetone, sparingly soluble in alcohol, very slightly soluble in hexane.

It melts at 87 °C to 95 °C.

It shows polymorphism and the thermodynamically stable form has low bioavailability following oral administration.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 1 ml of 1 M *sodium hydroxide* and 5 ml of *acetone R* and allow to stand for 30 min. Add 1.1 ml of 1 M *hydrochloric acid* and 3 ml of *acetone R*.

Reference solution (a). Dissolve 10 mg of *chloramphenicol CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *palmitic acid R* in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Apply to the plate 4 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of a 100 g/l solution of *ammonium acetate R* and 70 volumes of *alcohol R*. Allow the plate to dry in air and spray with a solution containing 0.2 g/l of *dichlorofluorescein R* and 0.1 g/l of *rhodamine B R* in *alcohol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows three spots corresponding in position to the principal spots in the chromatograms obtained with reference solutions (a), (b) and (c).

- B. Dissolve 0.2 g in 2 ml of *pyridine R*, add 2 ml of a 100 g/l solution of *potassium hydroxide R* and heat on a water-bath. A red colour is produced.

C. Dissolve 10 mg in 5 ml of *alcohol R* and add 4.5 ml of *dilute sulphuric acid R* and 50 mg of *zinc powder R*. Allow to stand for 10 min and if necessary decant the supernatant liquid or filter. Cool the solution in iced water and add 0.5 ml of *sodium nitrite solution R*. Allow to stand for 2 min and add 1 g of *urea R*, 2 ml of *strong sodium hydroxide solution R* and 1 ml of *β-naphthol solution R*. A red colour develops.

TESTS

Acidity. Dissolve 1.0 g in 5 ml of a mixture of equal volumes of *alcohol R* and *ether R*, warming to 35 °C. Add 0.2 ml of *phenolphthalein solution R*. Not more than 0.4 ml of 0.1 M *sodium hydroxide* is required to produce a pink colour persisting for 30 s.

Specific optical rotation (2.2.7). Dissolve 1.25 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 22.5 to + 25.5.

Free chloramphenicol. Not more than 450 ppm. Dissolve 1.0 g, with gentle heating, in 80 ml of *xylene R*. Cool and shake with three quantities, each of 15 ml, of *water R*. Dilute the combined aqueous extracts to 50 ml with *water R* and shake with 10 ml of *toluene R*. Allow to separate and discard the toluene layer. Centrifuge a portion of the aqueous layer and measure the absorbance (*A*) (2.2.25) at the maximum at 278 nm using as the compensation liquid a blank solution having an absorbance not greater than 0.05.

Calculate the content of free chloramphenicol in parts per million from the expression:

$$\frac{A \times 10^4}{5.96}$$

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *chloramphenicol palmitate isomer CRS* in *acetone R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Reference solution (b). Dissolve 20 mg of *chloramphenicol dipalmitate CRS* in *acetone R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Reference solution (c). Dissolve 5 mg of *chloramphenicol CRS* in *acetone R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R*, 40 volumes of *chloroform R* and 50 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spots corresponding to chloramphenicol palmitate isomer and chloramphenicol dipalmitate are not more intense than the corresponding spots in the chromatograms obtained with reference solutions (a) and (b) respectively (2.0 per cent) and any spot, apart from the principal spot and the spots corresponding to chloramphenicol palmitate isomer and chloramphenicol dipalmitate, is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by heating at 80 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 90.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 250.0 ml with *alcohol R*. Measure the absorbance (2.2.25) of the solution at the maximum at 271 nm.

Calculate the content of C₂₇H₄₂Cl₂N₂O₆ taking the specific absorbance to be 178.

STORAGE

Store protected from light.

IMPURITIES

A. (1*R*,2*R*)-2-[(dichloroacetyl)amino]-3-hydroxy-1-(4-nitrophenyl)propyl hexadecanoate (chloramphenicol palmitate isomer),

B. (1*R*,2*R*)-2-[(dichloroacetyl)amino]-1-(4-nitrophenyl)propane-1,3-diyl bis(hexadecanoate) (chloramphenicol dipalmitate).

01/2005:0709

CHLORAMPHENICOL SODIUM SUCCINATE

Chloramphenicoli natrii succinas

1 isomer : R1 = CO-CH₂-CH₂-CO₂Na, R3 = H

3 isomer : R1 = H, R3 = CO-CH₂-CH₂-CO₂Na

C₁₅H₁₅Cl₂N₂NaO₈

M_r 445.2

DEFINITION

Chloramphenicol sodium succinate, a mixture in variable proportions of sodium (2*R*,3*R*)-2-[(dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propyl butanedioate (3 isomer) and of sodium (1*R*,2*R*)-2-[(dichloroacetyl)amino]-3-hydroxy-1-(4-nitrophenyl)propyl butanedioate (1 isomer), contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of C₁₅H₁₅Cl₂N₂NaO₈, calculated with reference to the anhydrous substance.

CHARACTERS

A white or yellowish-white powder, hygroscopic, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄* R as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in 2 ml of *acetone* R.

Reference solution (a). Dissolve 20 mg of *chloramphenicol sodium succinate* CRS in 2 ml of *acetone* R.

Reference solution (b). Dissolve 20 mg of *chloramphenicol* CRS in 2 ml of *acetone* R.

Apply separately to the plate 2 µl of each solution.

Develop over a path of 15 cm using a mixture of 1 volume of *dilute acetic acid* R, 14 volumes of *methanol* R and 85 volumes of *chloroform* R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution are similar in position and size to those in the chromatogram obtained with reference solution (a). Their positions are different from that of the principal spot in the chromatogram obtained with reference solution (b).

B. Dissolve about 10 mg in 1 ml of *alcohol (50 per cent V/V)* R, add 3 ml of a 10 g/l solution of *calcium chloride* R and 50 mg of *zinc powder* R and heat on a water-bath for 10 min. Filter the hot solution and allow to cool. Add 0.1 ml of *benzoyl chloride* R and shake for 1 min. Add 0.5 ml of *ferric chloride solution* R1 and 2 ml of *chloroform* R and shake. The upper layer is light violet-red to purple.

C. Dissolve 50 mg in 1 ml of *pyridine* R. Add 0.5 ml of *dilute sodium hydroxide solution* R and 1.5 ml of *water* R. Heat in a water-bath for 3 min. A red colour develops. Add 2 ml of *nitric acid* R and cool under running water. Add 1 ml of 0.1 M *silver nitrate*. A white precipitate is formed slowly.

D. It gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Dissolve 2.50 g in *carbon dioxide-free water* R and dilute to 10 ml with the same solvent. The pH of the solution is 6.4 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.50 g in *water* R and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 5.0 to + 8.0, calculated with reference to the anhydrous substance.

Chloramphenicol and chloramphenicol disodium disuccinate. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *chloramphenicol* CRS in the mobile phase and dilute to 100.0 ml with the mobile phase (*solution a* †). Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *chloramphenicol disodium disuccinate* CRS in the mobile phase and dilute to 100.0 ml with the mobile phase (*solution b* †). Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 25 mg of the substance to be examined in the mobile phase, add 5 ml of solution (a') and 5 ml of solution (b') and dilute to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography* R (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 5 volumes of a 20 g/l solution of *phosphoric acid* R, 40 volumes of *methanol* R and 55 volumes of *water* R,
- as detector a spectrophotometer set at 275 nm,
- a 20 µl fixed-loop injector.

Inject the test solution and each of the reference solutions. The test is not valid unless, in the chromatogram obtained with reference solution (c), the two peaks corresponding to those in the chromatograms obtained with reference solutions (a) and (b) are clearly separated from the peaks corresponding to the two principal peaks in the chromatogram obtained with the test solution. If necessary, adjust the methanol content of the mobile phase.

In the chromatogram obtained with the test solution, the area of any peak corresponding to chloramphenicol is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent); the area of any peak corresponding to chloramphenicol disodium disuccinate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Water (2.5.12). Not more than 2.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Pyrogens (2.6.8). If intended for use in the manufacture of a parenteral dosage form without a further appropriate procedure for removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 2.5 ml of a solution in *water for injections* R containing 2 mg of the substance to be examined per millilitre.

ASSAY

Dissolve 0.200 g in *water* R and dilute to 500.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water* R. Measure the absorbance (2.2.25) at the maximum at 276 nm.

Calculate the content of C₁₅H₁₅Cl₂N₂NaO₈, taking the specific absorbance to be 220.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container, protected from light.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

01/2005:1086

CHLORCYCLIZINE HYDROCHLORIDE

Chlorcyclizini hydrochloridum

and enantiomer, HCl

C₁₈H₂₂Cl₂N₂M_r 337.3

DEFINITION

Chlorcyclizine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-1-[(4-chlorophenyl)phenylmethyl]-4-methylpiperazine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, freely soluble in water and in methylene chloride, soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Dissolve 10.0 mg in a 5 g/l solution of *sulphuric acid R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 5 g/l solution of *sulphuric acid R*. Examined between 215 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 231 nm. The specific absorbance at the maximum is 475 to 525, calculated with reference to the dried substance.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorcyclizine hydrochloride CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances (see Tests). The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 5.0 to 6.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using a plate coated with a suitable silica gel.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 5 ml of test solution (a) to 100 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *chlorcyclizine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *methylpiperazine R* in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution (c). Dilute 1 ml of test solution (b) to 25 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *hydroxyzine hydrochloride CRS* and 10 mg of *chlorcyclizine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution and develop over a path of 15 cm using a mixture of 2 volumes of *concentrated ammonia R*, 13 volumes of *methanol R* and 85 volumes of *methylene chloride R*. Allow the plate to dry in air and expose it to iodine vapour for 10 min. In the chromatogram obtained with test solution (a): any spot corresponding to methylpiperazine is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent); any spot, apart from the principal

spot and any spot corresponding to methylpiperazine, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 130 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 1 ml of 0.1 *M hydrochloric acid* and 50 ml of *methanol R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 33.73 mg of C₁₈H₂₂Cl₂N₂.

STORAGE

Store protected from light.

IMPURITIES

A. *N*-methylpiperazine.

01/2005:0656

CHLORDIAZEPOXIDE

Chlordiazepoxidum

C₁₆H₁₄ClN₃O

M_r 299.8

DEFINITION

7-Chloro-*N*-methyl-5-phenyl-3*H*-1,4-benzodiazepin-2-amine 4-oxide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: almost white or light yellow, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *chlordiazepoxide CRS*.

TESTS

Related substances. Liquid chromatography (2.2.29). *Carry out the test protected from bright light and prepare the solutions immediately before use.*

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *nitrazepam R* in the mobile phase, add 25.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of *aminochlorobenzophenone R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: acetonitrile *R*, water *R* (50:50 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 μ l.

Run time: 6 times the retention time of chlordiazepoxide.

Retention time: nitrazepam = about 3.1 min;
chlordiazepoxide = about 3.6 min.

Relative retention with reference to chlordiazepoxide:
impurity A = about 0.7; impurity B = about 2.3;
impurity C = about 3.9.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to nitrazepam and chlordiazepoxide.

Limits:

- **impurities A, B:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **any other impurity:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g, with heating if necessary, in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M* perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* perchloric acid is equivalent to 29.98 mg of $C_{16}H_{14}ClN_3O$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. 7-chloro-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one 4-oxide,

B. 6-chloro-2-(chloromethyl)-4-phenylquinazoline 3-oxide,

C. (2-amino-5-chlorophenyl)phenylmethanone (aminochlorobenzophenone).

01/2005:0474

CHLORDIAZEPOXIDE HYDROCHLORIDE

Chlordiazepoxidi hydrochloridum

$C_{16}H_{15}Cl_2N_3O$

M_r 336.2

DEFINITION

7-Chloro-*N*-methyl-5-phenyl-3*H*-1,4-benzodiazepin-2-amine 4-oxide hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder, slightly hygroscopic.

Solubility: soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *chlordiazepoxide hydrochloride CRS*.

B. Dissolve 50 mg in 5 ml of *water R*, add 1 ml of *dilute ammonia R1*, mix, allow to stand for 5 min and filter. Acidify the filtrate with *dilute nitric acid R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, Method II).

Dissolve 2.5 g in carbon dioxide-free water R and dilute to 25 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Carry out the following operations protected from bright light and prepare the solutions immediately before use.

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of nitrazepam R in the mobile phase, add 25.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of aminochlorobenzophenone R in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: acetonitrile R, water R (50:50 V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 μ l.

Run time: 6 times the retention time of chlordiazepoxide.

Retention time: nitrazepam = about 3.1 min;
chlordiazepoxide = about 3.6 min.

Relative retention with reference to chlordiazepoxide:
impurity A = about 0.7; impurity B = about 2.3;
impurity C = about 3.9.

System suitability: reference solution (b):

- resolution: minimum 2.0 between the peaks due to nitrazepam and chlordiazepoxide.

Limits:

- impurities A, B: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- impurity C: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- any other impurity: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- total: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 80 ml of *anhydrous acetic acid* R, heating if necessary. Cool and add 10 ml of *mercuric acetate solution* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 33.62 mg of C₁₆H₁₅Cl₂N₃O.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. 7-chloro-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one 4-oxide,

B. 6-chloro-2-(chloromethyl)-4-phenylquinazoline 3-oxide,

C. (2-amino-5-chlorophenyl)phenylmethanone (aminochlorobenzophenone).

01/2005:0657

CHLORHEXIDINE DIACETATE

Chlorhexidini diacetatas

C₂₆H₃₈Cl₂N₁₀O₄

M_r 625.6

DEFINITION

Chlorhexidine diacetate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1,1'-(hexane-1,6-diyl)bis[5-(4-chlorophenyl)biguanide] diacetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, microcrystalline powder, sparingly soluble in water, soluble in alcohol, slightly soluble in glycerol and in propylene glycol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorhexidine diacetate CRS*.
- B. Dissolve about 5 mg in 5 ml of a warm 10 g/l solution of *cetrimide R* and add 1 ml of *strong sodium hydroxide solution R* and 1 ml of *bromine water R*. A deep red colour is produced.
- C. Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *hydrochloric acid R* and *water R*. Add 40 ml of *water R*, filter if necessary and cool in ice water. Make alkaline to *titan yellow paper R* by adding dropwise and with stirring *strong sodium hydroxide solution R* and add 1 ml in excess. Filter, wash the precipitate with *water R* until the washings are free from alkali and recrystallise from *alcohol (70 per cent V/V) R*. Dry at 100 °C to 105 °C. The residue melts (2.2.14) at 132 °C to 136 °C.
- D. It gives reaction (a) of acetates (2.3.1).

TESTS

Chloroaniline. Dissolve 0.20 g of the substance to be examined in 25 ml of *water R* with shaking if necessary. Add 1 ml of *hydrochloric acid R* and dilute to 30 ml with *water R*. Add rapidly and with thorough mixing after each addition: 2.5 ml of *dilute hydrochloric acid R*, 0.35 ml of *sodium nitrite solution R*, 2 ml of a 50 g/l solution of *ammonium sulphamate R*, 5 ml of a 1.0 g/l solution of *naphthylethylenediamine dihydrochloride R* and 1 ml of *alcohol R*, dilute to 50.0 ml with *water R* and allow to stand for 30 min. Any reddish-blue colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 10.0 ml of a 0.010 g/l solution of *chloroaniline R* in *dilute hydrochloric acid R* and 20 ml of *dilute hydrochloric acid R* instead of the solution of the substance to be examined (500 ppm).

Related substances. Examined by liquid chromatography (2.2.29).

Test solution. Dissolve 0.200 g of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dissolve 15 mg of *chlorhexidine for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 2.5 ml of the test solution to 100 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10 ml with the mobile phase. Dilute 1.0 ml of this solution to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.2 m long and 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow-rate of 1.0 ml/min, a solution of 2.0 g of *sodium octanesulphonate R* in a mixture of 120 ml of *glacial acetic acid R*, 270 ml of *water R* and 730 ml of *methanol R*,

– as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase for at least 1 h. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). The test is not valid unless the resulting chromatogram is similar to the specimen chromatogram provided with *chlorhexidine for performance test CRS* in that the peaks due to impurity-A and impurity-B precede that due to chlorhexidine. If necessary, adjust the concentration of acetic acid in the mobile phase (increasing the concentration decreases the retention times).

Inject separately 10 µl of the test solution and 10 µl each of reference solutions (b) and (c). Record the chromatograms of reference solutions (b) and (c) until the peak due to chlorhexidine has been eluted and record the chromatogram of the test solution for six times the retention time of the peak due to chlorhexidine. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak with a relative retention time of 0.25 or less with respect to the principal peak and any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (c).

Loss on drying (2.2.32). Not more than 3.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.15 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 100 ml of *anhydrous acetic acid R* and titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 15.64 mg of $C_{26}H_{38}Cl_2N_{10}O_4$.

IMPURITIES

A. 1-(4-chlorophenyl)-5-[6-(3-cyanoguanidino)hexyl]biguanide,

B. [[[6-[5-(4-chlorophenyl)guanidino]hexyl]amino]iminomethyl]urea,

C. 1,1'-[hexane-1,6-diylbis[imino(iminocarbonyl)]]bis[3-(4-chlorophenyl)urea],

D. 1,1'-[[(4-chlorophenyl)amino]iminomethyl]imino]methylene]bis[imino(hexane-1,6-diyl)]bis[5-(4-chlorophenyl)biguanide].

01/2005:0658
corrected

CHLORHEXIDINE DIGLUCONATE SOLUTION

Chlorhexidini digluconatis solutio

$C_{34}H_{54}Cl_2N_{10}O_{14}$

M_r 898

DEFINITION

Chlorhexidine digluconate solution is an aqueous solution which contains not less than 190 g/l and not more than 210 g/l of 1,1'-[hexane-1,6-diyl]bis[5-(4-chlorophenyl)biguanide] di-D-gluconate.

CHARACTERS

An almost colourless or pale-yellowish liquid, miscible with water, with not more than 3 parts of acetone and with not more than 5 parts of ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. To 1 ml add 40 ml of *water R*, cool in iced water, make alkaline to *titan yellow paper R* by adding dropwise and with stirring *strong sodium hydroxide solution R* and add 1 ml in excess. Filter, wash the precipitate with *water R* until the washings are free from alkali and recrystallise from *alcohol (70 per cent V/V) R*. Dry at 100 °C to 105 °C. Examine the residue by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorhexidine CRS*.

B. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dilute 10.0 ml of the solution to be examined to 50 ml with *water R*.

Reference solution. Dissolve 25 mg of *calcium gluconate CRS* in 1 ml of *water R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *ethyl acetate R*, 10 volumes of *concentrated ammonia R*, 30 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate at 100 °C for 20 min, allow to cool and spray with a 50 g/l solution of *potassium dichromate R* in a 40 per cent *m/m* solution of *sulphuric acid R*. After 5 min, the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 1 ml add 40 ml of *water R*, cool in iced water, make alkaline to *titan yellow paper R* by adding dropwise and with stirring *strong sodium hydroxide solution R* and add 1 ml in excess. Filter, wash the precipitate with *water R* until the washings are free from alkali and recrystallise from *alcohol (70 per cent V/V) R*. Dry at 100 °C to 105 °C. The residue melts (2.2.14) at 132 °C to 136 °C.

D. To 0.05 ml add 5 ml of a 10 g/l solution of *cetrimide R*, 1 ml of *strong sodium hydroxide solution R* and 1 ml of *bromine water R*; a deep red colour is produced.

TESTS

Relative density (2.2.5): 1.06 to 1.07.

pH (2.2.3). Dilute 5.0 ml to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 5.5 to 7.0.

Chloroaniline. Dilute 2.0 ml to 100 ml with *water R*. To 10 ml of the solution add 2.5 ml of *dilute hydrochloric acid R* and dilute to 20 ml with *water R*. Add rapidly and with thorough mixing after each addition: 0.35 ml of *sodium nitrite solution R*, 2 ml of a 50 g/l solution of *ammonium sulphamate R*, 5 ml of a 1 g/l solution of *naphthylethylenediamine dihydrochloride R*, 1 ml of *alcohol R*, dilute to 50.0 ml with *water R* and allow to stand for 30 min.

Any reddish-blue colour in the solution is not greater than that in a standard prepared at the same time in the same manner using a mixture of 10.0 ml of a 0.010 g/l solution of *chloroaniline R* in *dilute hydrochloric acid R* and 10 ml of *water R* instead of the dilution of the solution to be examined (0.25 per cent with reference to chlorhexidine digluconate at a nominal concentration of 200 g/l).

Related substances. Examined by liquid chromatography (2.2.29).

Test solution. Dilute 5.0 ml of the sample to be examined to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 15 mg of *chlorhexidine for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 3.0 ml of the test solution to 100 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 50 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.2 m long and 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow-rate of 1.0 ml/min, a solution of 2.0 g of *sodium octanesulphonate R* in a mixture of 120 ml of *glacial acetic acid R*, 270 ml of *water R* and 730 ml of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with mobile phase for at least 1 hour. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). The test is not valid unless the resulting chromatogram is similar to the specimen chromatogram provided with *chlorhexidine for performance test CRS* in that the peaks due to impurity A and impurity B precede that due to chlorhexidine. If necessary, adjust the concentration of acetic acid in the mobile phase (increasing the concentration decreases the retention times).

Inject separately 10 µl of the test solution and 10 µl each of reference solutions (b) and (c). Record the chromatograms of reference solutions (b) and (c) until the peak due to chlorhexidine has been eluted and record the chromatogram of the test solution for six times the retention time of the peak due to chlorhexidine. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Disregard any peak with a relative retention time of 0.25 or less with respect to the principal peak and any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (c).

ASSAY

Determine the density (2.2.5) of the solution to be examined. Transfer 1.00 g to a 250 ml beaker and add 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.44 mg of $C_{22}H_{32}Cl_4N_{10}O_{14}$.

STORAGE

Store protected from light.

IMPURITIES

A. 1-(4-chlorophenyl)-5-[6-(3-cyanoguanidino)hexyl]biguanide,

B. [[[(6-[5-(4-chlorophenyl)guanidino]hexyl)amino]iminomethyl]urea],

C. 1,1'-[hexane-1,6-diylbis[imino(iminocarbonyl)]]bis[3-(4-chlorophenyl)urea],

D. 1,1'-[[[(4-chlorophenyl)amino]iminomethyl]imino]methylene]bis[imino(hexane-1,6-diyl)]bis[5-(4-chlorophenyl)biguanide].

01/2005:0659

CHLORHEXIDINE DIHYDROCHLORIDE

Chlorhexidini dihydrochloridum

$C_{22}H_{32}Cl_4N_{10}$

M_r 578.4

DEFINITION

Chlorhexidine dihydrochloride contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1,1'-(hexane-1,6-diyl)bis[5-(4-chlorophenyl)biguanide] dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water and in propylene glycol, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorhexidine dihydrochloride CRS*.
- Dissolve about 5 mg in 5 ml of a warm 10 g/l solution of *cetrimide R* and add 1 ml of *strong sodium hydroxide solution R* and 1 ml of *bromine water R*. A dark red colour is produced.
- Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *hydrochloric acid R* and *water R*. Add 40 ml of *water R*, filter if necessary and cool in iced water. Make alkaline to *titan yellow paper R* by adding dropwise, and with stirring, *strong sodium hydroxide solution R* and add 1 ml in excess. Filter, wash the precipitate with *water R*.

until the washings are free from alkali and recrystallise from *alcohol* (70 per cent V/V) *R*. Dry at 100 °C to 105 °C. The residue melts (2.2.14) at 132 °C to 136 °C.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Chloroaniline. To 0.20 g of the substance to be examined add 1 ml of *hydrochloric acid R*, shake for about 30 s, dilute to 30 ml with *water R* and shake until a clear solution is obtained. Add rapidly and with thorough mixing after each addition: 2.5 ml of *dilute hydrochloric acid R*, 0.35 ml of *sodium nitrite solution R*, 2 ml of a 50 g/l solution of *ammonium sulphamate R*, 5 ml of a 1.0 g/l solution of *naphthylethylenediamine dihydrochloride R* and 1 ml of *alcohol R*; dilute to 50.0 ml with *water R* and allow to stand for 30 min. Any reddish-blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 ml of a 0.010 g/l solution of *chloroaniline R* in *dilute hydrochloric acid R* and 20 ml of *dilute hydrochloric acid R* instead of the solution of the substance to be examined (500 ppm).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.200 g of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dissolve 15 mg of *chlorhexidine for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 2.5 ml of the test solution to 100 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10 ml with the mobile phase. Dilute 1.0 ml of the solution to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.2 m long and 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min, a solution of 2.0 g of *sodium octanesulphonate R* in a mixture of 120 ml of *glacial acetic acid R*, 270 ml of *water R* and 730 ml of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase for at least 1 h. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). The test is not valid unless the resulting chromatogram is similar to the specimen chromatogram provided with *chlorhexidine for performance test CRS* in that the peaks due to impurity A and impurity B precede that due to chlorhexidine. If necessary, adjust the concentration of acetic acid in the mobile phase (increasing the concentration decreases the retention times).

Inject 10 µl of the test solution and 10 µl each of reference solutions (b) and (c). Record the chromatograms of reference solutions (b) and (c) until the peak due to chlorhexidine is eluted and record the chromatogram of the test solution for six times the retention time of the peak due to chlorhexidine. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak, is not greater than the area of the principal peak in the

chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak with a relative retention time of 0.25 or less, with respect to chlorhexidine, and any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 100.0 mg in 5 ml of *anhydrous formic acid R* and add 70 ml of *acetic anhydride R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 14.46 mg of $C_{22}H_{32}Cl_4N_{10}$.

IMPURITIES

A. 1-(4-chlorophenyl)-5-[6-(3-cyanoguanidino)hexyl]biguanide,

B. [[[6-[5-(4-chlorophenyl)guanidino]hexyl]amino]iminomethyl]urea,

C. 1,1'-[hexane-1,6-diylbis[imino(iminocarbonyl)]]bis[3-(4-chlorophenyl)urea],

D. 1,1'-[(((4-chlorophenyl)amino]iminomethyl)imino)methylene]bis[imino(hexane-1,6-diyl)]bis[5-(4-chlorophenyl)biguanide].

01/2005:0382 STORAGE

In an airtight container.

CHLOROBUTANOL, ANHYDROUS

Chlorobutanolum anhydricum

 $C_4H_7Cl_3O$ M_r 177.5**DEFINITION**

Anhydrous chlorobutanol contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1,1,1-trichloro-2-methylpropan-2-ol, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, sublimes readily, slightly soluble in water, very soluble in alcohol, soluble in glycerol (85 per cent).

It melts at about 95 °C, determined without previous drying.

IDENTIFICATION

- Add about 20 mg to a mixture of 1 ml of *pyridine R* and 2 ml of *strong sodium hydroxide solution R*. Heat in a water-bath and shake. Allow to stand. The pyridine layer becomes red.
- Add about 20 mg to 5 ml of *ammoniacal silver nitrate solution R* and warm slightly. A black precipitate is formed.
- To about 20 mg add 3 ml of *1 M sodium hydroxide* and shake to dissolve. Add 5 ml of *water R* and then, slowly, 2 ml of *iodinated potassium iodide solution R*. A yellowish precipitate is formed.
- It complies with the test for water (see Tests).

TESTS

Solution S. Dissolve 5 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Acidity. To 4 ml of solution S add 15 ml of *alcohol R* and 0.1 ml of *bromothymol blue solution R1*. Not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Chlorides (2.4.4). Dissolve 0.17 g in 5 ml of *alcohol R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (300 ppm). When preparing the standard, replace the 5 ml of *water R* by 5 ml of *alcohol R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 2.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 20 ml of *alcohol R*. Add 10 ml of *dilute sodium hydroxide solution R*, heat in a water-bath for 5 min and cool. Add 20 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R* and shake vigorously. Add 2 ml of *ferric ammonium sulphate solution R2* and titrate with *0.1 M ammonium thiocyanate* until an orange colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 5.92 mg of $C_4H_7Cl_3O$.

CHLOROBUTANOL HEMIHYDRATE

Chlorobutanolum hemihydricum

 $C_4H_7Cl_3O \cdot \frac{1}{2}H_2O$ M_r 186.5**DEFINITION**

Chlorobutanol hemihydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1,1,1-trichloro-2-methylpropan-2-ol, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, sublimes readily, slightly soluble in water, very soluble in alcohol, soluble in glycerol (85 per cent).

It melts at about 78 °C, determined without previous drying.

IDENTIFICATION

- Add about 20 mg to a mixture of 1 ml of *pyridine R* and 2 ml of *strong sodium hydroxide solution R*. Heat in a water-bath and shake. Allow to stand. The pyridine layer becomes red.
- Add about 20 mg to 5 ml of *ammoniacal silver nitrate solution R* and warm slightly. A black precipitate is formed.
- To about 20 mg add 3 ml of *1 M sodium hydroxide* and shake to dissolve. Add 5 ml of *water R* and then, slowly, 2 ml of *iodinated potassium iodide solution R*. A yellowish precipitate is formed.
- It complies with the test for water (see Tests).

TESTS

Solution S. Dissolve 5 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Acidity. To 4 ml of solution S add 15 ml of *alcohol R* and 0.1 ml of *bromothymol blue solution R1*. Not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Chlorides (2.4.4). To 1 ml of solution S add 4 ml of *alcohol R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm). When preparing the standard, replace the 5 ml of *water R* by 5 ml of *alcohol R*.

Water (2.5.12). 4.5 per cent to 5.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 20 ml of *alcohol R*. Add 10 ml of *dilute sodium hydroxide solution R*, heat in a water-bath for 5 min and cool. Add 20 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R* and

shake vigorously. Add 2 ml of *ferric ammonium sulphate solution R2* and titrate with 0.1 M *ammonium thiocyanate* until an orange colour is obtained.

1 ml of 0.1 M *silver nitrate* is equivalent to 5.92 mg of C_7H_7ClO .

STORAGE

In an airtight container.

01/2005:0384

CHLOROCRESOL

Chlorocresolum

C_7H_7ClO

M_r 142.6

DEFINITION

Chlorocresol contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 4-chloro-3-methylphenol.

CHARACTERS

A white or almost white, crystalline powder or compacted crystalline masses supplied as pellets or colourless or white crystals, slightly soluble in water, very soluble in alcohol, freely soluble in fatty oils. It dissolves in solutions of alkali hydroxides.

IDENTIFICATION

- Melting point (2.2.14): 64 °C to 67 °C.
- To 0.1 g add 0.2 ml of *benzoyl chloride R* and 0.5 ml of *dilute sodium hydroxide solution R*. Shake vigorously until a white, crystalline precipitate is formed. Add 5 ml of *water R* and filter. The precipitate, recrystallised from 5 ml of *methanol R* and dried at 70 °C, melts (2.2.14) at 85 °C to 88 °C.
- To 5 ml of solution S (see Tests) add 0.1 ml of *ferric chloride solution R1*. A bluish colour is produced.

TESTS

Solution S. To 3.0 g, finely powdered, add 60 ml of *carbon dioxide-free water R*, shake for 2 min and filter.

Appearance of solution. Dissolve 1.25 g in *alcohol R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is orange or red. Not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to produce a pure yellow colour.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 1.0 g of the substance to be examined in *acetone R* and dilute to 100 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a glass column 1.80 m long and 3 mm to 4 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* impregnated with 3 per cent *m/m* to 5 per cent *m/m* of *polymethylphenylsiloxane R*,

- nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,

- a flame-ionisation detector,

maintaining the temperature of the column at 125 °C, that of the injection port at 210 °C and that of the detector at 230 °C. Continue the chromatography for three times the period of time (about 8 min) required for the appearance of the peak corresponding to chlorocresol. In the chromatogram obtained, the sum of the areas of the peaks apart from that corresponding to chlorocresol does not exceed 1 per cent of the total area of the peaks. Disregard the peak corresponding to the solvent.

Non-volatile matter. Evaporate 2.0 g to dryness on a water-bath and dry the residue at 100 °C to 105 °C. The residue weighs not more than 2 mg (0.1 per cent).

ASSAY

In a ground-glass-stoppered flask, dissolve 70.0 mg in 30 ml of *glacial acetic acid R*. Add 25.0 ml of 0.0167 M *potassium bromate*, 20 ml of a 150 g/l solution of *potassium bromide R* and 10 ml of *hydrochloric acid R*. Allow to stand protected from light for 15 min. Add 1 g of *potassium iodide R* and 100 ml of *water R*. Titrate with 0.1 M *sodium thiosulphate*, shaking vigorously and using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of 0.0167 M *potassium bromate* is equivalent to 3.565 mg of C_7H_7ClO .

STORAGE

Store protected from light.

01/2005:0544

CHLOROQUINE PHOSPHATE

Chloroquini phosphas

$C_{18}H_{32}ClN_3O_8P_2$

M_r 515.9

DEFINITION

Chloroquine phosphate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*⁴-(7-chloroquinolin-4-yl)-*N*²,*N*²-diethylpentane-1,4-diamine bis(dihydrogen phosphate), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, very slightly soluble in alcohol and in methanol.

It exists in 2 forms, one of which melts at about 195 °C and the other at about 218 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Examined between 210 nm and 370 nm (2.2.25), the solution shows absorption maxima at 220 nm, 235 nm, 256 nm, 329 nm and 342 nm. The specific absorbances at the maxima are respectively 600 to 660, 350 to 390, 300 to 330, 325 to 355 and 360 to 390.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with the base isolated from *chloroquine sulphate CRS*. Record the spectra using solutions prepared as follows: dissolve separately 0.1 g of the substance to be examined and 80 mg of the reference substance in 10 ml of *water R*, add 2 ml of *dilute sodium hydroxide solution R* and shake with 2 quantities, each of 20 ml, of *methylene chloride R*; combine the organic layers, wash with *water R*, dry over *anhydrous sodium sulphate R*, evaporate to dryness and dissolve the residues separately, each in 2 ml of *methylene chloride R*.
- C. Dissolve 25 mg in 20 ml of *water R* and add 8 ml of *picric acid solution R1*. The precipitate, washed with *water R*, with *alcohol R* and finally with *methylene chloride R*, melts (2.2.14) at 206–209 °C.
- D. Dissolve 0.1 g in 10 ml of *water R*, add 2 ml of *dilute sodium hydroxide solution R* and shake with 2 quantities, each of 20 ml, of *methylene chloride R*. The aqueous layer, acidified by the addition of *nitric acid R*, gives reaction (b) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ or GY₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.8 to 4.3.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Apply to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *diethylamine R*, 40 volumes of *cyclohexane R* and 50 volumes of *chloroform R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). Dissolve 2.0 g in 10 ml of *water R*. Add 5 ml of *concentrated ammonia R* and shake with 40 ml of *methylene chloride R*. Filter the aqueous layer and neutralise the filtrate with *glacial acetic acid R*. Heat on a water-bath to eliminate methylene chloride, allow to cool and dilute to 20.0 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb R)*.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.79 mg of C₁₈H₂₈ClN₃O₄S·H₂O.

STORAGE

In an airtight container, protected from light.

01/2005:0545

CHLOROQUINE SULPHATE

Chloroquini sulfas

C₁₈H₂₈ClN₃O₄S·H₂OM_r 436.0

DEFINITION

Chloroquine sulphate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*⁴-(7-chloroquinolin-4-yl)-*N*¹,*N*²-diethylpentane-1,4-diamine sulphate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in methanol, very slightly soluble in alcohol.

It melts at about 208 °C (instantaneous method).

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Examined between 210 nm and 370 nm (2.2.25), the solution shows absorption maxima at 220 nm, 235 nm, 256 nm, 329 nm and 342 nm. The specific absorbances at the maxima are respectively 730 to 810, 430 to 470, 370 to 410, 400 to 440 and 430 to 470.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with the base isolated from *chloroquine sulphate CRS*. Record the spectra using solutions prepared as follows: dissolve separately 0.1 g of the substance to be examined and of the reference substance in 10 ml of *water R*, add 2 ml of *dilute sodium hydroxide solution R* and shake with two quantities, each of 20 ml, of *chloroform R*; combine the chloroform layers, wash with *water R*, dry over *anhydrous sodium sulphate R*, evaporate to dryness and dissolve the residues separately each in 2 ml of *chloroform R*.
- C. Dissolve 25 mg in 20 ml of *water R* and add 8 ml of *picric acid solution R1*. The precipitate, washed with *water R*, with *alcohol R* and finally with *ether R*, melts (2.2.14) at 206 °C to 209 °C.
- D. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ or GY₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 5.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Apply separately to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *diethylamine R*, 40 volumes of *cyclohexane R* and 50 volumes of *chloroform R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). Dissolve 2.0 g in 10 ml of *water R*. Add 5 ml of *concentrated ammonia R* and shake with 40 ml of *ether R*. Filter the aqueous layer and neutralise the filtrate with *glacial acetic acid R*. Heat on a water-bath to eliminate ether, allow to cool and dilute to 20.0 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12): 3.0 per cent to 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 41.8 mg of C₇H₆ClN₃O₄S₂.

STORAGE

Store in an airtight container, protected from light.

DEFINITION

Chlorothiazide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 6-chloro-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in acetone, slightly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

A. Dissolve 80.0 mg in 100 ml of 0.1 M *sodium hydroxide* and dilute to 1000.0 ml with *water R*. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 M *sodium hydroxide*. Examined between 220 nm and 320 nm (2.2.25), the solution shows 2 absorption maxima, at 225 nm and 292 nm, and a shoulder at about 310 nm. The specific absorbances at the maxima are 725 to 800 and 425 to 455, respectively.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorothiazide CRS*.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 25 mg of *chlorothiazide CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 10 cm using *ethyl acetate R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 0.1 g add a pellet of *sodium hydroxide R* and heat strongly. Gas is evolved which turns *red litmus paper R* blue. After cooling, take up the residue with 10 ml of *dilute hydrochloric acid R*. Gas is evolved which turns *lead acetate paper R* black.

TESTS

Solution S. To 1.0 g of the powdered substance to be examined add 50 ml of *water R*, shake for 2 min and filter.

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of 0.01 M *sodium hydroxide* and 0.15 ml of *methyl red solution R*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution. Dilute 1 ml of the test solution to 100 ml with *acetone R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *2-propanol R* and 85 volumes of *ethyl acetate R*. Dry the plate in a current of air until the solvents have evaporated (about 10 min) and spray with a mixture of equal volumes of *alcoholic solution*

01/2005:0385

CHLOROTHIAZIDE

Chlorothiazidum

C₇H₆ClN₃O₄S₂M_r 295.7

of *sulphuric acid R* and *alcohol R*; use about 10 ml for a plate 200 mm square and spray in small portions, allowing the solvent to evaporate each time to avoid excessive wetting. Heat at 100–105 °C for 30 min and immediately place the plate above, but not in contact with, 10 ml of a saturated solution of *sodium nitrite R* in a glass tank. Carefully add 0.5 ml of *sulphuric acid R* to the sodium nitrite solution, close the tank, and allow to stand for 15 min. Remove the plate, heat in a ventilated oven at 40 °C for 15 min and spray with 3 quantities, each of 5 ml, of a freshly prepared 5 g/l solution of *naphthylethylenediamine dihydrochloride R* in *alcohol R*. Examine the plate by transmitted light. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Chlorides (2.4.4). 15 ml of solution S complies with the limit test for chlorides (160 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *dimethylformamide R*. Titrate with 0.1 M *tetrabutylammonium hydroxide in 2-propanol* determining the end-point potentiometrically (2.2.20) at the first point of inflexion. Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide in 2-propanol* is equivalent to 29.57 mg of $C_{20}H_{23}ClN_2O_4$.

01/2005:0386

CHLORPHENAMINE MALEATE

Chlorphenamini maleas

$C_{20}H_{23}ClN_2O_4$

M_r 390.9

DEFINITION

Chlorphenamine maleate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (3*RS*)-3-(4-chlorophenyl)-*N,N*-dimethyl-3-(pyridin-2-yl)propan-1-amine hydrogen (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 132 °C to 135 °C.

- B. Dissolve 30.0 mg in 0.1 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of this solution to 100.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 265 nm. The specific absorbance at the maximum is 200 to 220.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorphenamine maleate CRS*. Examine the substances prepared as discs.
- D. Dissolve 0.1 g in 10 ml of *water R* and add dropwise and with shaking 25 ml of *picric acid solution R*. Collect the precipitate on a sintered-glass filter. The precipitate, washed with 3 ml of *alcohol R*, recrystallised from a mixture of equal volumes of *alcohol R* and *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 196 °C to 200 °C.
- E. To 0.2 g add 3 ml of *water R* and 1 ml of *strong sodium hydroxide solution R*. Shake with three quantities, each of 5 ml, of *ether R*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min. No colour develops. To the remainder of the aqueous layer add 2 ml of *bromine solution R*. Heat in a water-bath for 15 min, heat to boiling and cool. To 0.2 ml of the solution add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R* and heat on a water-bath for 15 min. A blue colour develops.

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.5 g of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 1 ml of the test solution to 50 ml with *chloroform R*. Dilute 1 ml of this solution to 10 ml with *chloroform R*.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *diethylamine R*, 40 volumes of *chloroform R* and 50 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent). Disregard any spots remaining on the starting-line.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 19.54 mg of $C_{20}H_{23}ClN_2O_4$.

STORAGE

Store protected from light.

01/2005:0475

CHLORPROMAZINE HYDROCHLORIDE

Chlorpromazini hydrochloridum

 $C_{17}H_{20}Cl_2N_2S$
 M_r 355.3

DEFINITION

Chlorpromazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-(2-chloro-10*H*-phenothiazin-10-yl)-*N,N*-dimethylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, freely soluble in alcohol. It decomposes on exposure to air and light.

It melts at about 196 °C.

IDENTIFICATION

First identification: B, C, D.

Second identification: A, C, D.

- Prepare the solutions protected from bright light and measure the absorbances immediately. Dissolve 50.0 mg in 0.1 *M* hydrochloric acid and dilute to 500.0 ml with the same acid. Dilute 5.0 ml of the solution to 100.0 ml with 0.1 *M* hydrochloric acid. Examined between 230 nm and 340 nm (2.2.25), the solution shows two absorption maxima, at 254 nm and 306 nm respectively. The specific absorbance at the maximum at 254 nm is 890 to 960.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with chlorpromazine hydrochloride CRS. Examine the substances as 60 g/l solutions in methylene chloride *R* using a 0.1 mm cell.
- It complies with the identification test for phenothiazines by thin-layer chromatography (2.3.3).
- It gives reaction (b) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 1.0 g in carbon dioxide-free water *R* and dilute to 10 ml with the same solvent. The pH of the freshly prepared solution is 3.5 to 4.5.

Related substances. Carry out the test protected from bright light.

Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 5 volumes of diethylamine *R* and 95 volumes of methanol *R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 200 ml with a mixture of 5 volumes of diethylamine *R* and 95 volumes of methanol *R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of acetone *R*, 10 volumes of diethylamine *R* and 80 volumes of cyclohexane *R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the starting point.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 *M* hydrochloric acid and 50 ml of alcohol *R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume of 0.1 *M* sodium hydroxide added between the two points of inflexion.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 35.53 mg of C₁₇H₂₀Cl₂N₂S.

STORAGE

Store in an airtight container, protected from light.

01/2005:1087

CHLORPROPAMIDE

Chlorpropamidum

 $C_{10}H_{13}ClN_2O_3S$
 M_r 276.7

DEFINITION

Chlorpropamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[(4-chlorophenyl)sulphonyl]-3-propylurea, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides. It shows polymorphism.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Melting point (2.2.14): 126 °C to 130 °C.

B. Dissolve 0.10 g in methanol *R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric

STORAGE

Store protected from light.

CHLORPROPAMIDE

Chlorpropamidum

 $C_{10}H_{13}ClN_2O_3S$
 M_r 276.7

DEFINITION

Chlorpropamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[(4-chlorophenyl)sulphonyl]-3-propylurea, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides. It shows polymorphism.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Melting point (2.2.14): 126 °C to 130 °C.

B. Dissolve 0.10 g in methanol *R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric

acid. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 232 nm. The specific absorption at the maximum is 570 to 630.

- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlorpropamide CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance in *methylene chloride R*, evaporate to dryness and record the new spectra using the residues.
- D. Heat 0.1 g with 2 g of *anhydrous sodium carbonate R* until a dull red colour appears for 10 min. Allow to cool, extract the residue with about 5 ml of *water R*, dilute to 10 ml with *water R* and filter. The solution gives the reaction (a) of chloride (2.3.1).

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 15 mg of *4-chlorobenzenesulphonamide R* (chlorpropamide impurity A) in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 15 mg of *chlorpropamide impurity B CRS* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (c). Dilute 0.3 ml of the test solution to 100 ml with *acetone R*.

Reference solution (d). Dilute 5 ml of reference solution (c) to 15 ml with *acetone R*.

Reference solution (e). Dissolve 0.10 g of the substance to be examined, 5 mg of *4-chlorobenzenesulphonamide R* and 5 mg of *chlorpropamide impurity B CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 11.5 volumes of *concentrated ammonia R*, 30 volumes of *cyclohexane R*, 50 volumes of *methanol R* and 100 volumes of *methylene chloride R*. Allow the plate to dry in a current of cold air, heat at 110 °C for 10 min. At the bottom of a chromatographic tank, place an evaporating dish containing a mixture of 1 volume of *hydrochloric acid R*, 1 volume of *water R* and 2 volumes of a 50 g/l solution of *potassium permanganate R*, close the tank and allow to stand for 15 min. Place the dried hot plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 2 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Spray with *potassium iodide and starch solution R*. In the chromatogram obtained with the test solution: any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.3 per cent); any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent); any spot, apart from the principal spot and any spot corresponding to impurity A and B, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.3 per cent); not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference

solution (e) shows three clearly separated spots with approximate R_f values of 0.4, 0.6 and 0.9 corresponding to chlorpropamide, impurity A and impurity B respectively.

Heavy metals (2.4.8). Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* previously neutralised using *phenolphthalein solution R1* as indicator and add 25 ml of *water R*. Titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.67 mg of $C_{10}H_{13}ClN_2O_3S$.

STORAGE

Store protected from light.

IMPURITIES

A. R = H: 4-chlorobenzenesulphonamide,

C. R = CO-NH₂: [(4-chlorophenyl)sulphonyl]urea.

B. 1,3-dipropylurea,

01/2005:0815

CHLORPROTHIXENE HYDROCHLORIDE

Chlorprothixeni hydrochloridum

$C_{18}H_{19}Cl_2NS$

M_r 352.3

DEFINITION

(Z)-3-(2-Chloro-9H-thioxanthen-9-ylidene)-N,N-dimethylpropan-1-amine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water and in alcohol, slightly soluble in methylene chloride.

mp: about 220 °C.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 0.25 g in 10 ml of *water R*. Add 1 ml of *dilute sodium hydroxide solution R*. Shake with 20 ml of *methylene chloride R*. Separate the organic layer and wash with 5 ml of *water R*. Evaporate the organic layer to dryness and dry the residue at 40-50 °C. Examine the residues prepared as discs.

Comparison: *chlorprothixene hydrochloride CRS*.

B. Dissolve 0.2 g in a mixture of 5 ml of *dioxan R* and 5 ml of a 1.5 g/l solution of *sodium nitrite R*. Add 0.8 ml of *nitric acid R*. After 10 min add the solution to 20 ml of *water R*. 1 h later filter the precipitate formed. The filtrate is used immediately for identification test C. Dissolve the precipitate by warming in about 15 ml of *alcohol R* and add the solution to 10 ml of *water R*. Filter and dry the precipitate at 100-105 °C for 2 h. The melting point (2.2.14) is 152 °C to 154 °C.

C. To 1 ml of the filtrate obtained in identification test B, add 0.2 ml of a suspension of 50 mg of *fast red B salt R* in 1 ml of *alcohol R*. Add 1 ml of 0.5 M *alcoholic potassium hydroxide*. A dark red colour is produced. Carry out a blank test.

D. Dissolve about 20 mg in 2 ml of *nitric acid R*. A red colour is produced. Add 5 ml of *water R* and examine in ultraviolet light at 365 nm. The solution shows green fluorescence.

E. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 4.4 to 5.2 for solution S.

Related substances. Liquid chromatography (2.2.29). *Carry out the test protected from bright light.*

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *chlorprothixene hydrochloride CRS* (with a defined content of *E*-isomer) in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 3.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

- **size:** $l = 0.12$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography *R* (3 µm or 5 µm).

Mobile phase: solution containing 6.0 g/l of *potassium dihydrogen phosphate R*, 2.9 g/l of *sodium laurilsulfate R* and 9 g/l of *tetrabutylammonium bromide R* in a mixture of 50 volumes of *methanol R*, 400 volumes of *acetonitrile R* and 550 volumes of *distilled water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: for about 30 min with the mobile phase.

Injection: 20 µl.

Run time: twice the retention time of chlorprothixene.

Relative retention with reference to chlorprothixene: impurity E = about 1.55.

System suitability: reference solution (a):

- **retention time:** chlorprothixene = about 10 min,
- **relative retention** with reference to chlorprothixene: *E*-isomer = about 1.35.

Limits:

- ***E*-isomer:** not more than 2.0 per cent, calculated from the area of the corresponding peak in the chromatogram obtained with reference solution (a) and taking into account the assigned content of this isomer in *chlorprothixene hydrochloride CRS*,
- **impurity E:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent taking into account a response factor of 3),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **total of any other impurity:** not more than 2.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 35.23 mg of $C_{18}H_{19}Cl_2NS$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. (RS)-2-chloro-9-[3-(dimethylamino)propyl]-9H-thioxanthen-9-ol,

- B. R1 = H, R2 = CH-CH₂-CH₂-N(CH₃)₂, R3 = H: *N,N*-dimethyl-3-(9*H*-thioxanthen-9-ylidene)propan-1-amine,
- C. R1 = Cl, R2 = CH-CH₂-CH₂-NH-CH₃, R3 = H: (*Z*)-3-(2-chloro-9*H*-thioxanthen-9-ylidene)-*N*-methylpropan-1-amine,
- D. R1 = H, R2 = CH-CH₂-CH₂-N(CH₃)₂, R3 = Cl: (*Z*)-3-(4-chloro-9*H*-thioxanthen-9-ylidene)-*N,N*-dimethylpropan-1-amine,
- E. R1 = Cl, R2 = O, R3 = H: 2-chloro-9*H*-thioxanthen-9-one,

- F. (*E*)-3-(2-chloro-9*H*-thioxanthen-9-ylidene)-*N,N*-dimethylpropan-1-amine (*E*-isomer).

01/2005:0546

CHLORTALIDONE

Chlortalidonum

C₁₄H₁₁ClN₂O₄SM_r 338.8

DEFINITION

Chlortalidone contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2-chloro-5-[(1*R*S)-1-hydroxy-3-oxo-2,3-dihydro-1*H*-isoindol-1-yl]benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, soluble in acetone and in methanol, slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of the alkali hydroxides.

It melts at about 220 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

- A. Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *alcohol R*. Examined between 230 nm and 340 nm (2.2.25), the solution shows 2 absorption maxima, at 275 nm and 284 nm. The ratio of the absorbance measured at the absorption maximum at 284 nm to that measured at the absorption maximum at 275 nm is 0.73 to 0.88.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *chlortalidone CRS*. Examine the substances prepared as discs using *potassium bromide R*.

- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *chlortalidone CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *chlortalidone CRS* and 10 mg of *hydrochlorothiazide CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 1.5 volumes of *water R* and 98.5 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- D. Dissolve about 10 mg in 1 ml of *sulphuric acid R*. An intense yellow colour develops.
- E. It complies with the test for optical rotation (see Tests).

TESTS

Appearance of solution. Dissolve 1.0 g in *dilute sodium hydroxide solution R* and dilute to 10 ml with the same solution. The solution is clear (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Acidity. Dissolve 1.0 g with heating in a mixture of 25 ml of *acetone R* and 25 ml of *carbon dioxide-free water R*. Cool. Titrate with 0.1 *M sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Not more than 0.75 ml of 0.1 *M sodium hydroxide* is required.

Optical rotation (2.2.7). Dissolve 0.20 g in *methanol R* and dilute to 20 ml with the same solvent. The angle of optical rotation is −0.15° to +0.15°.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 1 volume of *water R* and 4 volumes of *acetone R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *chlortalidone impurity B CRS* and 20 mg of *chlortalidone CRS* in a mixture of 1 volume of *water R* and 4 volumes of *acetone R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of the test solution to 200 ml with a mixture of 1 volume of *water R* and 4 volumes of *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *toluene R*, 10 volumes of *xylene R*, 20 volumes of *concentrated ammonia R*, 30 volumes of *dioxan R* and 30 volumes of *2-propanol R*. Allow the plate to dry in a current of warm air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spot corresponding to impurity B is not more

01/2005:0173

intense than the corresponding spot in the chromatogram obtained with reference solution (a) (1 per cent); and any spot, apart from the principal spot and the spot corresponding to impurity B, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (a) shows 2 clearly separated spots.

Chlorides (2.4.4). Triturate 0.3 g, add 30 ml of *water R*, shake for 5 min and filter. 15 ml of the filtrate complies with the limit test for chlorides (350 ppm). Prepare the standard using 10 ml of *chloride standard solution (5 ppm Cl) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *acetone R*. In an atmosphere of nitrogen, titrate with 0.1 *M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 *M tetrabutylammonium hydroxide* is equivalent to 33.88 mg of $C_{14}H_{11}ClN_2O_4S$.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.

- A. $R = H$, $R' = OH$: 2-(4-chloro-3-sulphobenzoyl)benzoic acid,
 B. $R = H$, $R' = NH_2$: 2-(4-chloro-3-sulphamoylbenzoyl)benzoic acid,
 C. $R = C_2H_5$, $R' = NH_2$: ethyl 2-(4-chloro-3-sulphamoylbenzoyl)benzoate,
 I. $R = CH(CH_3)_2$, $R' = NH_2$: 1-methylethyl 2-(4-chloro-3-sulphamoylbenzoyl)benzoate,

- D. $R = OC_2H_5$, $R' = SO_2NH_2$: 2-chloro-5-[(1*RS*)-1-ethoxy-3-oxo-2,3-dihydro-1*H*-isoindol-1-yl]benzenesulphonamide,
 E. $R = H$, $R' = SO_2NH_2$: 2-chloro-5-[(1*RS*)-3-oxo-2,3-dihydro-1*H*-isoindol-1-yl]benzenesulphonamide,
 G. $R = OH$, $R' = Cl$: (3*RS*)-3-(3,4-dichlorophenyl)-3-hydroxy-2,3-dihydro-1*H*-isoindol-1-one,
 H. $R = OCH(CH_3)_2$, $R' = SO_2NH_2$: 2-chloro-5-[(1*RS*)-1-(1-methylethoxy)-3-oxo-2,3-dihydro-1*H*-isoindol-1-yl]benzenesulphonamide,

- F. bis[2-chloro-5-(1-hydroxy-3-oxo-2,3-dihydro-1*H*-isoindol-1-yl)benzenesulfonyl]amine.

CHLORTETRACYCLINE HYDROCHLORIDE

Chlortetracyclini hydrochloridum

Compound	R	Molecular formula	M_r
Chlortetracycline hydrochloride	Cl	$C_{22}H_{24}Cl_2N_2O_8$	515.3
Tetracycline hydrochloride	H	$C_{22}H_{25}ClN_2O_8$	480.9

DEFINITION

Mixture of antibiotics, the main component being the hydrochloride of (4*S*,4*aS*,5*aS*,6*S*,12*aS*)-7-chloro-4-(dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracycline-2-carboxamide (chlortetracycline hydrochloride), a substance produced by the growth of certain strains of *Streptomyces aureofaciens* or obtained by any other means.

Content:

- $C_{22}H_{24}Cl_2N_2O_8$: minimum 89.5 per cent (anhydrous substance),
- $C_{22}H_{25}ClN_2O_8$: maximum 8.0 per cent (anhydrous substance),
- 94.5 per cent to 102.0 per cent for the sum of the contents of chlortetracycline hydrochloride and tetracycline hydrochloride (anhydrous substance).

CHARACTERS

Appearance: yellow powder.

Solubility: slightly soluble in water and in alcohol. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

- A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *chlortetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *chlortetracycline hydrochloride CRS*, 5 mg of *doxycycline R* and 5 mg of *demeclocycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel F_{254} plate *R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 μ l.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- B. To about 2 mg add 5 ml of *sulphuric acid R*. A deep blue colour develops which becomes bluish-green. Add the solution to 2.5 ml of *water R*. The colour becomes brownish.
- C. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 2.3 to 3.3.

Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*, heating slightly.

Specific optical rotation (2.2.7): – 235 to – 250 (anhydrous substance).

Dissolve 0.125 g in *water R* and dilute to 50.0 ml with the same solvent.

Absorbance (2.2.25): maximum 0.40 at 460 nm.

Dissolve 0.125 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 25.0 mg of the substance to be examined in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *chlortetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 10.0 mg of *4-epichlortetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (c). Dissolve 20.0 mg of *tetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (d). Mix 5.0 ml of reference solution (a) and 10.0 ml of reference solution (b) and dilute to 25.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (e). Mix 5.0 ml of reference solution (b) and 5.0 ml of reference solution (c) and dilute to 50.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (f). Dilute 1.0 ml of reference solution (c) to 20.0 ml with 0.01 M *hydrochloric acid*. Dilute 5.0 ml of this solution to 200.0 ml with 0.01 M *hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *octylsilyl silica gel for chromatography R* (5 μ m),
- temperature: 35 °C.

Mobile phase: to 500 ml of *water R*, add 50 ml of *perchloric acid solution R*, shake and add 450 ml of *dimethyl sulphoxide R*,

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 μ l; inject the test solution and reference solutions (d), (e) and (f).

System suitability: reference solution (d):

- **resolution:** minimum 2.0 between the peaks due to impurity A and to chlortetracycline; if necessary, adjust the dimethyl sulphoxide content in the mobile phase,
- **symmetry factor:** maximum 1.3 for the peak due to chlortetracycline.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (4.0 per cent),
- **total of other impurities eluting between the solvent peak and the peak corresponding to chlortetracycline:** not more than 0.25 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (1.0 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (f) (0.1 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the standard using 2.5 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 2.0 per cent, determined on 0.300 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 1 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solutions (a) and (e).

Calculate the percentage content of $C_{22}H_{24}Cl_2N_2O_8$ using the chromatogram obtained with reference solution (a). Calculate the percentage content of $C_{22}H_{25}ClN_2O_8$ using the chromatogram obtained with reference solution (e).

STORAGE

Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (4*R*,4*aS*,5*aS*,6*S*,12*aS*)-7-chloro-4-(dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-epichlortetracycline),

- B. demeclocycline.

01/2005:0072

CHOLECALCIFEROL

Cholecalciferolum

 $C_{27}H_{44}O$ M_r 384.6

DEFINITION

Cholecalciferol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of (5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3 β -ol.

1 milligram of cholecalciferol is equivalent to 40 000 IU of antirachitic activity (vitamin D) in rats.

CHARACTERS

White or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light. Solutions in volatile solvents are unstable and are to be used immediately.

A reversible isomerisation to pre-cholecalciferol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cholecalciferol CRS*. Examine the substances prepared as discs.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.200 g rapidly and without heating in *aldehyde-free alcohol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation, determined within 30 min of preparing the solution, is + 105 to + 112.

ASSAY

Carry out the operations as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *cholecalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 μ m),
- as mobile phase at a flow rate of 2 ml/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks due to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the percentage content of cholecalciferol from the expression:

$$\frac{m'}{m} \times \frac{S_D}{S'_D} \times 100$$

m = mass of the substance to be examined in the test solution, in milligrams,

m' = mass of *cholecalciferol CRS* in reference solution (a), in milligrams,

S_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with the test solution,

S'_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (a).

STORAGE

Store in an airtight container, under nitrogen, protected from light, at a temperature between 2 °C and 8 °C.

The contents of an opened container are to be used immediately.

IMPURITIES

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3 β -ol (*trans*-cholecalciferol, *trans*-vitamin D₃),

B. cholesta-5,7-dien-3 β -ol (7,8-didehydrocholesterol, provitamin D₃),

C. 9 β ,10 α -cholesta-5,7-dien-3 β -ol (lumisterol₃),

D. (6*E*)-9,10-secocholesta-5(10),6,8(14)-trien-3 β -ol (iso-tachysterol₃),

E. (6*E*)-9,10-secocholesta-5(10),6,8-trien-3 β -ol (tachysterol₃).

01/2005:0575

CHOLECALCIFEROL CONCENTRATE (OILY FORM)

Cholecalciferolum densatum oleosum

DEFINITION

Cholecalciferol concentrate (oily form) consists of a solution of *Cholecalciferol* (0072) in a suitable vegetable fatty oil, authorised by the competent authority.

The content of cholecalciferol stated on the label is not less than 500 000 IU/g and the concentrate contains not less than 90.0 per cent and not more than 110.0 per cent of the content stated on the label. The concentrate may contain suitable stabilisers such as antioxidants.

CHARACTERS

A clear, yellow liquid, practically insoluble in water, slightly soluble in ethanol, miscible with solvents of fats.

Partial solidification may occur, depending on the temperature.

IDENTIFICATION

First identification: A, C.

Second identification: A, B.

A. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel G plate R.

Test solution. Dissolve an amount of the substance to be examined corresponding to 400 000 IU in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 10 mg of *cholecalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dissolve 10 mg of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Apply to the plate 20 μ l of each solution. Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/l of *butylhydroxytoluene R*. Allow the plate to dry in air and spray with *sulphuric acid R*. Compare the principal spot in the chromatogram obtained with the test solution with the principal spot in each of the chromatograms obtained with reference solution (a) and reference solution (b), respectively. The chromatogram obtained with the test solution shows immediately a bright yellow principal spot which rapidly becomes orange-brown, then gradually greenish-grey and remains so for 10 min. This spot is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows immediately at the same level an orange principal spot which gradually becomes reddish-brown and remains so for 10 min.

B. Prepare a solution in *cyclohexane R* containing the equivalent of about 400 IU/ml. Examined between 250 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 267 nm.

C. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution has a similar retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Acid value (2.5.1). Not more than 2.0, determined on 5.0 g dissolved in 25 ml of the prescribed mixture of solvents.

Peroxide value (2.5.5). Not more than 20.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve a quantity of the preparation to be examined, weighed with an accuracy of 0.1 per cent, equivalent to about 400 000 IU, in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *cholecalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

Reference solution (c). Dissolve 0.10 g of *cholecalciferol CRS* without heating in *toluene R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 50.0 ml with the mobile phase. Keep the solution in iced water.

Reference solution (e). Place 5.0 ml of reference solution (c) in a volumetric flask, add about 10 mg of *butylhydroxytoluene R* and displace air from the flask with *nitrogen R*. Heat in a water-bath at 90 °C under a reflux condenser protected from light and under *nitrogen R* for 45 min. Cool and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks due to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (d) and of reference solution (e).

Calculate the conversion factor (*f*) from the expression:

$$f = \frac{K - L}{M}$$

K = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (d),

L = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (e),

M = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with reference solution (e).

The value of *f* determined in duplicate on different days may be used during the entire procedure.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the content of cholecalciferol in International Units per gram from the expression:

$$\frac{m'}{V'} \times \frac{V}{m} \times \frac{S_D + (f \times S_p)}{S'_D} \times 40\,000 \times 1000$$

m = mass of the preparation to be examined in the test solution, in milligrams,

m' = mass of *cholecalciferol CRS* in reference solution (a), in milligrams,

V = volume of the test solution (100 ml),

V' = volume of reference solution (a) (100 ml),

S_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with the test solution,

S'_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (a),

S_p = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with the test solution,

f = conversion factor.

STORAGE

Store in an airtight, well-filled container, protected from light. The contents of an opened container are to be used as soon as possible; any unused part is to be protected by an atmosphere of nitrogen.

LABELLING

The label states:

- the number of International Units per gram,
- the method of restoring the solution if partial solidification occurs,
- the name of any added stabilisers.

IMPURITIES

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3β-ol (*trans*-cholecalciferol, *trans*-vitamin D₃),

B. cholesta-5,7-dien-3 β -ol (7,8-di dehydrocholesterol, provitamin D₃),

C. (9 β ,10 α)-cholesta-5,7-dien-3 β -ol (lumisterol₃),

D. (6E)-9,10-secholesta-5(10),6,8(14)-trien-3 β -ol (iso-tachysterol₃),

E. (6E)-9,10-secholesta-5(10),6,8-trien-3 β -ol (tachysterol₃).

01/2005:0574

CHOLECALCIFEROL CONCENTRATE (POWDER FORM)

Cholecalciferoli pulvis

DEFINITION

Cholecalciferol concentrate (powder form) is obtained by dispersing an oily solution of *Cholecalciferol* (0072) in an appropriate matrix which is usually based on a combination of gelatin and carbohydrates of suitable quality, authorised by the competent authority.

The declared content of cholecalciferol is not less than 100 000 IU/g and the concentrate contains not less than 90.0 per cent and not more than 110.0 per cent of the content stated on the label. The concentrate may contain suitable stabilisers such as antioxidants.

CHARACTERS

White or yellowish-white, small particles which, depending on their formulation, may be practically insoluble in water or may swell or form a dispersion.

IDENTIFICATION

First identification: A, C.

Second identification: A, B.

A. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel G plate R.

Test solution. Place 10.0 ml of the test solution prepared for the assay in a suitable flask and evaporate to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 0.4 ml of *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R*. Prepare immediately before use.

Reference solution (a). Dissolve 10 mg of *cholecalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dissolve 10 mg of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Apply to the plate 20 μ l of each solution. Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/l of *butylhydroxytoluene R*. Allow the plate to dry in air and spray with *sulphuric acid R*. Compare the principal spot in the chromatogram obtained with the test solution with the principal spot in each of the chromatograms obtained with reference solution (a) and reference solution (b), respectively. The chromatogram obtained with the test solution shows immediately a bright-yellow principal spot which rapidly becomes orange-brown, then gradually greenish-grey and remains so for 10 min. This spot is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows immediately at the same level an orange principal spot which gradually becomes reddish-brown and remains so for 10 min.

B. Place 5.0 ml of the test solution prepared for the assay in a suitable flask and evaporate to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 50.0 ml of *cyclohexane R*. Examined between 250 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 265 nm.

C. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution has a similar retention time to the principal peak in the chromatogram obtained with reference solution (a).

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Introduce into a saponification flask a quantity of the preparation to be examined, weighed with an accuracy of 0.1 per cent, equivalent to about 100 000 IU. Add 5 ml of *water R*, 20 ml of *ethanol R*, 1 ml of *sodium ascorbate solution R* and 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R*. Heat under a reflux condenser on a water-bath for 30 min. Cool rapidly under running water. Transfer the liquid to a separating funnel with the aid of two quantities, each of 15 ml, of *water R*, one quantity of 10 ml of *alcohol R* and two quantities, each of 50 ml, of *pentane R*. Shake vigorously for 30 s. Allow to stand until the two layers are clear. Transfer the lower aqueous-alcoholic layer to a second separating funnel and shake with a mixture of 10 ml of *alcohol R* and 50 ml of *pentane R*. After separation, transfer the aqueous-alcoholic layer to a third separating funnel and the pentane layer to the first separating funnel, washing the second separating funnel with two quantities, each of 10 ml, of *pentane R* and adding the washings to the first separating funnel. Shake the aqueous-alcoholic layer with 50 ml of *pentane R* and add the pentane layer to the first funnel. Wash the pentane layer with two quantities, each of 50 ml, of a freshly prepared 30 g/l solution of *potassium hydroxide R* in *alcohol (10 per cent V/V) R*, shaking vigorously, then wash with successive quantities, each of 50 ml, of *water R* until the washings are neutral to phenolphthalein. Transfer the washed pentane extract to a ground-glass-stoppered flask. Evaporate the contents of the flask to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 5.0 ml of *toluene R* and add 20.0 ml of the mobile phase to obtain a solution containing about 4000 IU/ml.

Reference solution (a). Dissolve 10.0 mg of *cholecalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 g of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

Reference solution (c). Dissolve 0.10 g of *cholecalciferol CRS* without heating in *toluene R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 50.0 ml with the mobile phase. Keep the solution in iced water.

Reference solution (e). Place 5.0 ml of reference solution (c) in a volumetric flask, add about 10 mg of *butylhydroxytoluene R* and displace air from the flask with *nitrogen R*. Heat in a water-bath at 90 °C under a reflux condenser protected from light and under *nitrogen R* for 45 min. Cool and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),
- as mobile phase at a flow rate of 2 ml/min, a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the

height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks due to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (d) and of reference solution (e).

Calculate the conversion factor (*f*) from the expression:

$$f = \frac{K - L}{M}$$

K = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (d),

L = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (e),

M = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with reference solution (e).

The value of *f* determined in duplicate on different days may be used during the entire procedure.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the content of cholecalciferol in International Units per gram from the expression:

$$\frac{m'}{V'} \times \frac{V}{m} \times \frac{S_D + (f \times S_p)}{S'_D} \times 40\,000 \times 1000$$

m = mass of the substance to be examined in the test solution, in milligrams,

m' = mass of *cholecalciferol CRS* in reference solution (a), in milligrams,

V = volume of the test solution (25 ml),

V' = volume of reference solution (a) (100 ml),

S_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with the test solution,

S'_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (a),

S_p = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with the test solution,

f = conversion factor.

STORAGE

Store in an airtight, well-filled container, protected from light. The contents of an opened container are to be used as soon as possible; any unused part is to be protected by an atmosphere of nitrogen.

LABELLING

The label states:

- the number of International Units per gram,
- the name of any added stabilisers.

IMPURITIES

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3β-ol (*trans*-cholecalciferol, *trans*-vitamin D₃),

B. cholesta-5,7-dien-3β-ol (7,8-di dehydrocholesterol, provitamin D₃),

C. (9β,10α)-cholesta-5,7-dien-3β-ol (lumisterol₃),

D. (6*E*)-9,10-secocholesta-5(10),6,8(14)-trien-3β-ol (iso-tachysterol₃),

E. (6*E*)-9,10-secocholesta-5(10),6,8-trien-3β-ol (tachysterol₃).

01/2005:0598

CHOLECALCIFEROL CONCENTRATE (WATER-DISPERSIBLE FORM)

Cholecalciferolum in aqua dispergibile

DEFINITION

Cholecalciferol concentrate (water-dispersible form) consists of a solution of *Cholecalciferol* (0072) in a suitable vegetable fatty oil, authorised by the competent authority, to which suitable solubilisers have been added.

The declared content of cholecalciferol is not less than 100 000 IU/g and the concentrate contains not less than 90.0 per cent and not more than 115.0 per cent of the content stated on the label. The concentrate may contain suitable stabilisers such as antioxidants.

CHARACTERS

A slightly yellowish liquid of variable opalescence and viscosity. Highly concentrated solutions may become cloudy at low temperatures or form a gel at room temperature.

IDENTIFICATION

First identification: A, C, D.

Second identification: A, B, D.

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Place 10.0 ml of the test solution prepared for the assay in a suitable flask and evaporate to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 0.4 ml of *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R*. Prepare immediately before use.

Reference solution (a). Dissolve 10 mg of *cholecalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dissolve 10 mg of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 4 ml with the same solvent. Prepare immediately before use.

Apply to the plate 20 µl of each solution. Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/l of *butylhydroxytoluene R*. Allow the plate to dry in air and spray with *sulphuric acid R*. Compare the principal spot

in the chromatogram obtained with the test solution with the principal spot in each of the chromatograms obtained with reference solution (a) and reference solution (b).

The chromatogram obtained with the test solution shows immediately a bright-yellow principal spot which rapidly becomes orange-brown, then gradually greenish-grey and remains so for 10 min. This spot is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows immediately at the same level an orange principal spot which gradually becomes reddish-brown and remains so for 10 min.

- B. Place 5.0 ml of the test solution prepared for the assay in a suitable flask and evaporate to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 50.0 ml of *cyclohexane R*. Examined between 250 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 265 nm.
- C. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution has a similar retention time to the principal peak in the chromatogram obtained with reference solution (a).
- D. Mix about 1 g with 10 ml of *water R* previously warmed to 50 °C and cool to 20 °C. Immediately after cooling, a uniform, slightly opalescent and slightly yellow dispersion is obtained.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Introduce into a saponification flask a quantity of the preparation to be examined, weighed with an accuracy of 0.1 per cent, equivalent to about 100 000 IU. Add 5 ml of *water R*, 20 ml of *ethanol R*, 1 ml of *sodium ascorbate solution R* and 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R*. Heat under a reflux condenser on a water-bath for 30 min. Cool rapidly under running water. Transfer the liquid to a separating funnel with the aid of two quantities, each of 15 ml, of *water R*, one quantity of 10 ml of *alcohol R* and two quantities, each of 50 ml, of *pentane R*. Shake vigorously for 30 s. Allow to stand until the two layers are clear. Transfer the aqueous-alcoholic layer to a second separating funnel and shake with a mixture of 10 ml of *alcohol R* and 50 ml of *pentane R*. After separation, transfer the aqueous-alcoholic layer to a third separating funnel and the pentane layer to the first separating funnel, washing the second separating funnel with two quantities, each of 10 ml, of *pentane R* and adding the washings to the first separating funnel. Shake the aqueous-alcoholic layer with 50 ml of *pentane R* and add the pentane layer to the first funnel. Wash the pentane layer with two quantities, each of 50 ml, of a freshly prepared 30 g/l solution of *potassium hydroxide R* in *alcohol (10 per cent V/V) R*, shaking vigorously, and then wash with successive quantities, each of 50 ml, of *water R* until the washings are neutral to phenolphthalein. Transfer the washed pentane extract to a ground-glass-stoppered flask. Evaporate the contents of the flask to dryness under reduced pressure by swirling in a water-bath at 40 °C. Cool under running water and restore atmospheric pressure with *nitrogen R*. Dissolve the residue immediately in 5.0 ml of *toluene R* and add 20.0 ml of the mobile phase to obtain a solution containing about 4000 IU/ml.

Reference solution (a). Dissolve 10.0 mg of *cholecalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 g of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

Reference solution (c). Dissolve 0.10 g of *cholecalciferol CRS* without heating in *toluene R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 50.0 ml with the mobile phase. Keep the solution in iced water.

Reference solution (e). Place 5.0 ml of reference solution (c) in a volumetric flask, add about 10 mg of *butylhydroxytoluene R* and displace air from the flask with *nitrogen R*. Heat in a water-bath at 90 °C under a reflux condenser protected from light and under *nitrogen R* for 45 min. Cool and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks due to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (d) and of reference solution (e).

Calculate the conversion factor (*f*) from the expression:

$$f = \frac{K - L}{M}$$

K = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (d),

L = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (e),

M = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with reference solution (e).

The value of *f* determined in duplicate on different days may be used during the entire procedure.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the content of cholecalciferol in International Units per gram from the expression:

$$\frac{m'}{V'} \times \frac{V}{m} \times \frac{S_D + (f \times S_p)}{S'_D} \times 40\,000 \times 1000$$

- m = mass of the preparation to be examined in the test solution, in milligrams,
- m' = mass of *cholecalciferol CRS* in reference solution (a), in milligrams,
- V = volume of the test solution (25 ml),
- V' = volume of reference solution (a) (100 ml),
- S_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with the test solution,
- S'_D = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (a),
- S_p = area (or height) of the peak due to pre-cholecalciferol in the chromatogram obtained with the test solution,
- f = conversion factor.

STORAGE

Store in an airtight, well-filled container, protected from light, at the temperature stated on the label.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once is to be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the principal solubiliser or solubilisers used and the name of any added stabilisers,
- the storage temperature.

IMPURITIES

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3β-ol (*trans*-cholecalciferol, *trans*-vitamin D₃),

B. cholesta-5,7-dien-3β-ol (7,8-di dehydrocholesterol, provitamin D₃),

C. (9β,10α)-cholesta-5,7-dien-3β-ol (lumisterol₃),

D. (6*E*)-9,10-secocholesta-5(10),6,8(14)-trien-3β-ol (iso-tachysterol₃),

E. (6*E*)-9,10-secocholesta-5(10),6,8-trien-3β-ol (tachysterol₃).

01/2005:0993

CHOLESTEROL

Cholesterolum

C₂₇H₄₆O

M_r 386.7

DEFINITION

Cholesterol contains not less than 95.0 per cent of cholest-5-en-3β-ol and not less than 97.0 per cent and not more than 103.0 per cent of total sterols, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in acetone and in alcohol. It is sensitive to light.

IDENTIFICATION

- A. Melting point (2.2.14): 147 °C to 150 °C.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*. Prepare the solutions immediately before use.
- Test solution.** Dissolve 10 mg of the substance to be examined in *ethylene chloride R* and dilute to 5 ml with the same solvent.
- Reference solution.** Dissolve 10 mg of *cholesterol CRS* in *ethylene chloride R* and dilute to 5 ml with the same solvent.
- Apply to the plate 20 µl of each solution. Develop immediately, protected from light, over a path of 15 cm using a mixture of 33 volumes of *ethyl acetate R* and 66 volumes of *toluene R*. Allow the plate to dry in air and spray 3 times with *antimony trichloride solution R*. Examine the chromatograms 3–4 min after spraying. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.
- C. Dissolve about 5 mg in 2 ml of *methylene chloride R*. Add 1 ml of *acetic anhydride R*, 0.01 ml of *sulphuric acid R* and shake. A pink colour is produced which rapidly changes to red, then to blue and finally to brilliant green.

TESTS

Solubility in alcohol. In a stoppered flask, dissolve 0.5 g in 50 ml of *alcohol R* at 50 °C. Allow to stand for 2 h. No deposit or turbidity is formed.

Acidity. Dissolve 1.0 g in 10 ml of *ether R*, add 10.0 ml of 0.1 M *sodium hydroxide* and shake for about 1 min. Heat gently to eliminate ether and then boil for 5 min. Cool, add 10 ml of *water R* and 0.1 ml of *phenolphthalein solution R* as indicator and titrate with 0.1 M *hydrochloric acid* until the pink colour just disappears, stirring the solution vigorously throughout the titration. Carry out a blank titration. The difference between the volumes of 0.1 M *hydrochloric acid* required to change the colour of the indicator in the blank and in the test is not more than 0.3 ml.

Loss on drying (2.2.32). Not more than 0.3 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by gas chromatography (2.2.28), using *pregnenolone isobutyrate CRS* as the internal standard.

Internal standard solution. Dissolve 0.100 g of *pregnenolone isobutyrate CRS* in *heptane R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 25.0 mg of the substance to be examined in the internal standard solution and dilute to 25.0 ml with the same solution.

Reference solution. Dissolve 25.0 mg of *cholesterol CRS* in the internal standard solution and dilute to 25.0 ml with the same solution.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.25 mm in internal diameter coated with *poly(dimethyl)siloxane R* (film thickness 0.25 µm),
- *helium for chromatography R* as the carrier gas with a split ratio of 1:25 at a flow rate of 2 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 275 °C, that of the injection port at 285 °C and that of the detector at 300 °C.

Inject 1.0 µl of each solution. The assay is not valid unless the resolution between the peaks due to pregnenolone isobutyrate and cholest-5-en-3β-ol in the chromatogram obtained with the reference solution is at least 10.0.

Calculate the percentage content of cholest-5-en-3β-ol, using the declared content of cholest-5-en-3β-ol in *cholesterol CRS*. Calculate the percentage content of total sterols by adding together the contents of cholest-5-en-3β-ol and other substances with a retention time less than or equal to 1.5 times the retention time of cholest-5-en-3β-ol. Disregard the peaks due to the internal standard and the solvent.

STORAGE

Store protected from light.

LABELLING

The label states the source material for the production of cholesterol (for example bovine brain and spinal cord, wool fat or chicken eggs).

IMPURITIES

A. 5α-cholest-7-en-3β-ol (lathosterol),

B. cholesta-5,24-dien-3β-ol (desmosterol),

C. 5α-cholesta-7,24-dien-3β-ol.

01/2005:0476

CHYMOTRYPSIN

Chymotrypsinum

DEFINITION

Chymotrypsin is a proteolytic enzyme obtained by the activation of chymotrypsinogen extracted from the pancreas of beef (*Bos taurus* L.). It has an activity not less than

5.0 microkatal per milligram. In solution it has maximal enzymic activity at about pH 8; the activity is reversibly inhibited at pH 3, at which pH it is most stable.

PRODUCTION

The animals from which chymotrypsin is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority; furthermore the tissues used shall not include any specified risk material as defined by any relevant international or, where appropriate, national legislation. It must have been shown to what extent the method of production allows inactivation or removal of any contamination by viruses or other infectious agents.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Histamine (2.6.10). Not more than 1 µg (calculated as histamine base) per 5 microkatal of chymotrypsin activity. Before carrying out the test, heat the solution of the substance to be examined on a water-bath for 30 min.

CHARACTERS

A white, crystalline or amorphous powder, sparingly soluble in water; the amorphous form is hygroscopic.

IDENTIFICATION

A. Dilute 1 ml of solution S (see Tests) to 10 ml with *water R*. In a depression in a white spot plate, mix 0.05 ml of this solution with 0.2 ml of substrate solution. A purple colour develops.

Substrate solution. To 24.0 mg of *acetyltyrosine ethyl ester R* add 0.2 ml of *alcohol R*, and swirl until solution is effected. Add 2.0 ml of 0.067 M phosphate buffer solution pH 7.0 *R* and 1 ml of *methyl red mixed solution R* and dilute to 10.0 ml with *water R*.

B. Dilute 0.5 ml of solution S to 5 ml with *water R*. Add 0.10 ml of a 20 g/l solution of *tosylphenylalanylchloromethane R* in *alcohol R*. Adjust to pH 7.0 and shake for 2 h. In a depression in a white spot plate, mix 0.05 ml of this solution with 0.2 ml of the substrate solution (see Identification test A). No colour develops within 3 min of mixing.

TESTS

Solution S. Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). The pH of solution S is 3.0 to 5.0.

Absorbance (2.2.25). Dissolve 30.0 mg in 0.001 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. The solution shows an absorption maximum at 281 nm and a minimum at 250 nm. The specific absorbance at the maximum is 18.5 to 22.5 and that at the minimum is not greater than 8.

Trypsin. Transfer to a depression in a white spot plate 0.05 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 8.1 R* and 0.1 ml of solution S. Add 0.2 ml of substrate solution (test solution). At the same time and in the same manner, prepare a reference solution using the substance to be examined to which not more than 1 per cent *m/m* of *trypsin BRP* has been added. Start a timer. No colour appears in the test solution within 3 min to 5 min after the addition of the substrate solution. A purple colour is produced in the control solution.

Substrate solution. To 98.5 mg of *tosylarginine methyl ester hydrochloride R*, suitable for assaying trypsin, add

5 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 8.1 R* and swirl to dissolve. Add 2.5 ml of *methyl red mixed solution R* and dilute to 25.0 ml with *water R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.100 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 2 h.

ASSAY

The activity of chymotrypsin is determined by comparing the rate at which it hydrolyses *acetyltyrosine ethyl ester R* with the rate at which *chymotrypsin BRP* hydrolyses the same substrate under the same conditions.

Apparatus. Use a reaction vessel of about 30 ml capacity provided with:

- a device that will maintain a temperature of 25.0 ± 0.1 °C,
- a stirring device, for example a magnetic stirrer,
- a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. For the latter the burette is graduated in 0.005 ml and the pH meter is provided with a wide scale and glass-calomel electrodes.

Test solution. Dissolve 25.0 mg of the substance to be examined in 0.001 M *hydrochloric acid* and dilute to 250.0 ml with the same acid.

Reference solution. Dissolve 25.0 mg of *chymotrypsin BRP* in 0.001 M *hydrochloric acid* and dilute to 250.0 ml with the same acid.

Store the solutions at 0 °C to 5 °C. Warm 1 ml of each solution to about 25 °C over 15 min and use 50 µl of each solution (corresponding to about 25 nanokatal) for each titration. Carry out the titration in an atmosphere of nitrogen. Transfer 10.0 ml of 0.01 M *calcium chloride solution R* to the reaction vessel and, while stirring, add 0.35 ml of 0.2 M *acetyltyrosine ethyl ester solution R*. When the temperature is steady at 25.0 ± 0.1 °C (after about 5 min) adjust the pH to exactly 8.0 with 0.02 M *sodium hydroxide*. Add 50 µl of the test solution (equivalent to about 5 µg of the substance to be examined) and start a timer. Maintain the pH at 8.0 by the addition of 0.02 M *sodium hydroxide*, noting the volume added every 30 s. Calculate the volume of 0.02 M *sodium hydroxide* used per second between 30 s and 210 s. Carry out a titration in the same manner using the reference solution and calculate the volume of 0.02 M *sodium hydroxide* used per second.

Calculate the activity in microkatal per milligram using the expression:

$$\frac{m' \times V}{m \times V'} \times A$$

m = mass of the substance to be examined, in milligrams,

m' = mass of *chymotrypsin BRP*, in milligrams,

V = volume of 0.02 M *sodium hydroxide* used per second by the test solution,

V' = volume of 0.02 M *sodium hydroxide* used per second by the reference solution,

A = activity of *chymotrypsin BRP*, in microkatal per milligram.

STORAGE

Store in an airtight container at 2 °C to 8 °C, protected from light.

LABELLING

The label states:

- the quantity of chymotrypsin and the total activity in microkatal per container,
- for the amorphous substance, that it is hygroscopic.

01/2005:1407

CICLOPIROX

Ciclopiroxum

C₁₂H₁₇NO₂M_r 207.3

DEFINITION

Ciclopirox contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 6-cyclohexyl-1-hydroxy-4-methylpyridin-2(1*H*)-one, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, slightly soluble in water, freely soluble in ethanol and in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Melting point (2.2.14): 140 °C to 145 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ciclopirox CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *ciclopirox CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Before use predevelop the plate with a mixture of 10 volumes of *concentrated ammonia R*, 15 volumes of *water R* and 75 volumes of *alcohol R* until the solvent front has migrated to the top of the plate. Allow the plate to dry in air for 5 min.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 15 volumes of *water R* and 75 volumes of *alcohol R*. Allow the plate to dry in air for 10 min and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Spray the plate with a 20 g/l solution of *ferric chloride R* in *ethanol R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. Dissolve 2.0 g in *methanol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29). Carry out the operations avoiding exposure to actinic light. All materials which are in direct contact with the substance to be examined like column materials, reagents, solvents and others should contain only very low amounts of extractable metal cations.

Solvent mixture. Mix 1 volume of *acetonitrile R* and 9 volumes of the mobile phase.

Test solution. Dissolve 30.0 mg of the substance to be examined in 15 ml of the solvent mixture. If necessary, use an ultrasonic bath. Dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 15.0 mg of *ciclopirox impurity A CRS* and 15.0 mg of *ciclopirox impurity B CRS* in the solvent mixture and dilute to 10.0 ml with the same solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the solvent mixture.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Reference solution (d). Mix 5 ml of reference solution (a) with 5 ml of the test solution.

The chromatographic procedure may be carried out using:

- a stainless steel column 80 mm long and 4 mm in internal diameter packed with *nitrile silica gel for chromatography R2* (5 µm),
- as rinsing solution a mixture of 1 volume of *glacial acetic acid R*, 1 volume of *acetylacetone R*, 500 volumes of *acetonitrile R* and 500 volumes of *water R*,
- as mobile phase at a flow rate of 0.7 ml/min a mixture of 0.1 ml of *glacial acetic acid R*, 230 ml of *acetonitrile R* and 770 ml of a 0.96 g/l solution of *sodium edetate R*. If the retention time of the principal peak in the chromatogram obtained with the test solution is not between 8 min and 11 min adjust the ratio of the 0.96 g/l solution of sodium edetate: acetonitrile accordingly,
- as detector a spectrophotometer set at 220 nm and 298 nm.

In order to ensure desorption of disruptive metal ions, every new column is to be rinsed with the rinsing solution over a period of not less than 15 h and then with the mobile phase for not less than 5 h at a flow rate of 0.2 ml/min.

Inject 10 µl each of the solvent mixture, the test solution and the reference solutions (b), (c) and (d) and record the chromatograms at 220 nm and 298 nm. Continue the chromatography of the test solution for 2.5 times the retention time of the principal peak.

The relative retention times are:

- impurity A: 0.5
- impurity C: 0.9
- ciclopirox: 1
- impurity B: 1.3

The test is not valid unless: in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to impurity B and ciclopirox is not less than 2.0; the chromatogram obtained with reference solution (c) shows at 298 nm a peak corresponding to impurity B with a signal-to-noise ratio of not less than three; in the chromatogram obtained with the test solution the symmetry factor of the principal peak is between 0.8 and 2.0.

01/2005:1302

In the chromatogram obtained with the test solution at 220 nm, the area of the peak due to impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) at the same wavelength (0.5 per cent). In the chromatogram obtained with the test solution at 298 nm, the area of any peak apart from the principal peak is not greater than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) at the same wavelength (0.5 per cent); the sum of all peak areas at 298 nm, apart from the principal peak and any peak due to impurity B, is not greater than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.5 per cent). At 298 nm disregard any peak due to the solvent and any peak with an area less than half the area of the peak due to impurity B in the chromatogram obtained with reference solution (c) at the same wavelength.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C over *diphosphorus pentoxide* R.

Sulphated ash (2.4.14). Not more than 0.1 per cent determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 20 ml of *methanol* R. Add 20 ml of *water* R and titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 20.73 mg of $C_{12}H_{17}NO_2$.

STORAGE

Store protected from light.

IMPURITIES

A. (RS)-2-(3-cyclohexyl-5-methyl-4,5-dihydroisoxazol-5-yl)acetic acid,

B. X = O: 6-cyclohexyl-4-methyl-2H-pyran-2-one,

C. X = NH: 6-cyclohexyl-4-methylpyridin-2(1H)-one.

CICLOPIROX OLAMINE

Ciclopirox olaminum

 $C_{14}H_{24}N_2O_3$
 M_r 268.4

DEFINITION

6-Cyclohexyl-1-hydroxy-4-methylpyridin-2(1H)-one and 2-aminoethanol.

Content:

- ciclopirox ($C_{12}H_{17}NO_2$; M_r 207.3): 76.0 per cent to 78.5 per cent (dried substance),
- 2-aminoethanol (C_2H_7NO ; M_r 61.1): 22.2 per cent to 23.3 per cent (dried substance).

CHARACTERS

Appearance: white or pale yellow, crystalline powder.

Solubility: sparingly soluble in water, very soluble in alcohol and in methylene chloride, slightly soluble in ethyl acetate, practically insoluble in cyclohexane.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ciclopirox olamine* CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethyl acetate* R, evaporate to dryness on a water-bath and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol* R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 25 mg of *ciclopirox olamine* CRS in *methanol* R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel F_{254} plate R.

Before use wash 2 plates by allowing a mixture of 10 volumes of *concentrated ammonia* R, 15 volumes of *water* R and 75 volumes of *ethanol* R to migrate until the solvent front has reached the top of the plate. Allow the plates to dry in air for 5 min.

Mobile phase: *concentrated ammonia* R, *water* R, *ethanol* R (10:15:75 V/V/V).

Application: 10 μ l.

Development: over a path of 15 cm.

Drying: in air for 10 min.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

Detection B: spray one plate with *ferric chloride solution R3*.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

Detection C: spray the second plate with *ninhydrin solution R*. Heat at 110 °C until the spots appear.

Results C: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent.

pH (2.2.3): 8.0 to 9.0.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Carry out the operations avoiding exposure to actinic light. All materials which are in direct contact with the substance to be examined, such as column materials, reagents, solvents, etc. should contain only small amounts of extractable metal cations.

Test solution. Dissolve 40.0 mg of the substance to be examined (corresponding to about 30 mg of ciclopirox) in a mixture of 20 µl of *anhydrous acetic acid R*, 2 ml of *acetonitrile R*, and 15 ml of the mobile phase. If necessary, use an ultrasonic bath. Dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 15.0 mg of *ciclopirox impurity A CRS* and 15.0 mg of *ciclopirox impurity B CRS* in a mixture of 1 ml of *acetonitrile R* and 7 ml of the mobile phase. Dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 200.0 ml with a mixture of 1 volume of *acetonitrile R* and 9 volumes of the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with a mixture of 1 volume of *acetonitrile R* and 9 volumes of the mobile phase.

Reference solution (d). Mix 5 ml of reference solution (a) with 5 ml of the test solution.

Column:

- size: $l = 80$ mm, $\varnothing = 4$ mm,
- stationary phase: *nitrile silica gel for chromatography R* (5 µm),
- rinsing solution: a mixture of 1 volume of *anhydrous acetic acid R*, 1 volume of *acetylacetone R*, 500 volumes of *acetonitrile R* and 500 volumes of *water R*.

Mobile phase: a mixture of 0.1 volumes of *anhydrous acetic acid R*, 230 volumes of *acetonitrile R* and 770 volumes of a 0.96 g/l solution of *sodium edetate R*. If the retention time of the principal peak in the chromatogram obtained with the test solution is not between 8 min and 11 min adjust the ratio of the 0.96 g/l solution of sodium edetate to acetonitrile accordingly.

Flow rate: 0.7 ml/min.

Detection: variable wavelength spectrophotometer capable of operating at 220 nm and 298 nm.

In order to ensure desorption of interfering metal ions, a new column is to be rinsed with the rinsing solution over a period of at least 15 h and then with the mobile phase for at least 5 h at a flow rate of 0.2 ml/min.

Injection: 10 µl; inject the test solution and reference solutions (b), (c) and (d).

Run time: 2.5 times the retention time of ciclopirox.

Relative retention with reference to ciclopirox:

impurity A = about 0.5; impurity C = about 0.9;

impurity B = about 1.3.

System suitability:

- **resolution:** minimum of 2.0 between the peaks corresponding to impurity B and ciclopirox in the chromatogram obtained with reference solution (d),
- **signal-to-noise ratio:** minimum of 10 for the peak corresponding to impurity B in the chromatogram obtained with reference solution (c) at 298 nm,
- **symmetry factor:** 0.8 to 2.0 for the principal peak in the chromatogram obtained with the test solution.

Limits:

- **impurity A at 220 nm:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) at the same wavelength (0.5 per cent),
- **any impurity at 298 nm:** not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) at the same wavelength (0.5 per cent),
- **total at 298 nm apart from impurity B:** not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit at 298 nm:** area of the peak due to impurity B in the chromatogram obtained with reference solution (c) at the same wavelength (0.1 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.5 per cent, determined on 1.000 g by drying under high vacuum.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

2-Aminoethanol. Dissolve 0.250 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 6.108 mg of C₂H₇NO.

Ciclopirox. Dissolve 0.200 g in 2 ml of *methanol R*. Add 38 ml of *water R*, swirl and titrate immediately with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Use 0.1 M *sodium hydroxide*, the titre of which has been determined under the conditions prescribed above using 0.100 g of *benzoic acid RV*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 20.73 mg of C₁₂H₁₇NO₂.

STORAGE

Protected from light.

IMPURITIES

- A. (RS)-2-(3-cyclohexyl-5-methyl-4,5-dihydroisoxazol-5-yl)acetic acid,

- B. 6-cyclohexyl-4-methyl-2H-pyran-2-one,

- C. 6-cyclohexyl-4-methylpyridin-2(1H)-one.

CICLOSPORIN

Ciclosporinum

DEFINITION

Ciclosporin contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of cyclo[[*(2S,3R,4R,6E)*-3-hydroxy-4-methyl-2-(methylamino)oct-6-enoyl]-L-2-aminobutanoyl-N-methylglycyl-N-methyl-L-leucyl-L-valyl-N-methyl-L-leucyl-L-alanyl-D-alanyl-N-methyl-L-leucyl-N-methyl-L-leucyl-N-methyl-L-valyl], calculated with reference to the dried substance. Ciclosporin is a substance produced by *Beauveria nivea* (*Tolypocladium inflatum* Gams) or obtained by any other means.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in ethanol and in methylene chloride.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ciclosporin CRS*.
- Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 1.5 g in *ethanol R* and dilute to 15 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 , BY_5 or R_7 (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.125 g in *methanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -185 to -193 , calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject separately the test solution and reference solution (b). Continue the chromatography for 1.7 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times that of the principal peak in the chromatogram with reference solution (b).

Heavy metals (2.4.8). The residue obtained in the test for loss on drying complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm *Pb*) *R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g at 60 °C at a pressure not exceeding 15 Pa for 3 h.

Bacterial endotoxins (2.6.14): less than 0.84 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Dissolve 50 mg of the substance to be examined in a mixture of 280 mg of *alcohol R* and 650 mg of *polyoxyethylated castor oil R* and dilute to the required concentration using water LAL.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30.0 mg of *ciclosporin CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 200.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Reference solution (c). Dissolve the contents of a vial of *ciclosporin for system suitability CRS* in 5.0 ml of the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm to 5 µm); the column is connected to the injection port by a steel capillary tube about 1 m long and having an internal diameter of 0.25 mm,
- as mobile phase at a flow rate of about 1.5 ml per minute a mixture of 1 volume of *phosphoric acid R*, 50 volumes of *1,1-dimethylethyl methyl ether R*, 430 volumes of *acetonitrile R* and 520 volumes of *water R*,
- as detector a spectrophotometer set at 210 nm,

– a 20 µl loop injector,

maintaining the temperature of the column and of the steel capillary tube at 80 °C.

Inject reference solution (c). The test is not valid unless the peak-to-valley ratio is minimum 1.4 where H_p = height above the baseline of the peak due to ciclosporin U and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ciclosporin. Adjust the ratio of 1,1 dimethylethylmethyl ether to acetonitrile, if necessary. The test is not valid unless the retention time of the principal peak is 25 min to 30 min. Adjust the ratio of acetonitrile to water, if necessary. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

Calculate the percentage content of ciclosporin.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. different ciclosporins [difference with ciclosporin ($R = CH_3$: ciclosporin A)]: ciclosporin B [7-L-Ala]; ciclosporin C [7-L-Thr]; ciclosporin D [7-L-Val]; ciclosporin E [5-L-Val]; ciclosporin G [7-(L-2-aminopentanoyl)]; ciclosporin H [5-D-MeVal]; ciclosporin L [$R = H$]; ciclosporin T [4-L-Leu]; ciclosporin U [11-L-Leu]; ciclosporin V [1-L-Abu],

- B. [6-[(2S,3R,4R)-3-hydroxy-4-methyl-2-(methylamino)octanoic acid]]ciclosporin A,
C. isociclosporin A.

01/2005:1408

CILASTATIN SODIUM

Cilastatinum natricum

$C_{16}H_{25}N_2NaO_5S$

M_r 380.4

DEFINITION

Cilastatin sodium contains not less than 98.0 per cent and not more than the equivalent of 101.5 per cent of sodium (Z)-7-[(R)-2-amino-2-carboxyethyl]sulphonyl]-2-[[[(1S)-2,2-dimethylcyclopropyl]carbonyl]amino]hept-2-enoate, calculated with reference to the anhydrous and solvent-free substance.

CHARACTERS

A white or light yellow amorphous powder, hygroscopic, very soluble in water and in methanol, soluble in dimethyl sulphoxide, slightly soluble in ethanol, practically insoluble in acetone and in methylene chloride.

IDENTIFICATION

- A. It complies with the test for specific optical rotation (see Tests).
B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cilastatin sodium CRS*.
C. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.5 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in a mixture of 1 volume of *hydrochloric acid R* and 120 volumes of *methanol R* and dilute to 25.0 ml with the same mixture of solvents. The specific optical rotation is + 41.5 to + 44.5, calculated with reference to the anhydrous and solvent-free substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 32.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*. Dilute 5.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (b). Dilute 5.0 ml the test solution to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 20.0 ml with *water R*.

Reference solution (c). Dissolve 16 mg of the substance to be examined in *dilute hydrogen peroxide solution R* and dilute to 10.0 ml with the same solvent. Allow to stand for 30 min. Dilute 1 ml of this solution to 100 ml with *water R*.

Reference solution (d). Dissolve 32 mg of *mesityl oxide R* in 100 ml of *water R*. Dilute 1 ml of the solution to 50 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.0 ml/min, the following mixtures:

Mobile phase A. Prepare a mixture of 300 volumes of *acetonitrile R* and 700 volumes of a 0.1 per cent V/V solution of *phosphoric acid R* in *water R*,

Mobile phase B. A 0.1 per cent V/V solution of *phosphoric acid R* in *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
	15	85
0 - 30	15 → 100	85 → 0
30 - 46	100	0
46 - 56	100 → 15	0 → 85

– as detector a spectrophotometer set at 210 nm,

– a 20 µl loop injector,

maintaining the temperature of the column at 50 °C.

Equilibrate the column with a mixture of 15 per cent V/V of mobile phase A and 85 per cent V/V of mobile phase B. Inject separately each solution. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 15 per cent of the full scale of the recorder.

The test is not valid unless, the chromatogram obtained with reference solution (c) shows three principal peaks: the first two peaks (cilastatin impurity A) may elute without being completely resolved and the mass distribution ratio of the third peak (cilastatin) is at least ten; in the chromatogram obtained with reference solution (a), the principal peak has a signal-to-noise ratio of at least 5.0.

In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak due to the solvent, any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (a) and any peak corresponding to the principal peak in the chromatogram obtained with reference solution (d).

Mesityl oxide, acetone and methanol. Not more than 1.0 per cent *m/m* of acetone, 0.5 per cent *m/m* of methanol and 0.4 per cent *m/m* of mesityl oxide. Examine by gas chromatography (2.2.28) using *propanol R* as the internal standard.

Internal standard solution. Dissolve 0.5 ml of *propanol R* in *water R* and dilute to 1000 ml with the same solvent.

Test solution. Dissolve 0.200 g of the substance to be examined in *water R*, add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

Reference solution. Dissolve 2.0 ml of *acetone R*, 0.5 ml of *methanol R* and 0.5 ml of *mesityl oxide R* in *water R* and dilute to 1000 ml with the same solvent. To 2.0 ml of this solution add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*. This solution contains 316 µg of acetone, 79 µg of methanol and 86 µg of mesityl oxide per millilitre.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.53 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 1.0 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 9 ml/min,
- a flame-ionisation detector,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 2.5	50	–	isothermal
	2.5 - 5	50 → 70	8	linear gradient
	5 - 5.5	70	–	isothermal
Injection port		160		
Detector		220		

Inject 1 µl of the reference solution and then 1 µl of the test solution. Calculate the percentage contents of acetone, methanol and mesityl oxide using the following expression:

$$\left(\frac{C}{W}\right) \times \left(\frac{R_u}{R_s}\right)$$

in which *C* is the concentration in µg/ml of the solvent in the reference solution, *W* is the quantity in milligrams of cilastatin sodium in the test solution and *R_u* and *R_s* are the ratios of the corresponding solvent peak areas to the propanol peak area in the test solution and the reference solution, respectively.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.300 g in 30 ml of *methanol R* and add 5 ml of *water R*. Add 0.1 M *hydrochloric acid* to a pH of about 3.0. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Three jumps of potential are observed. Titrate to the third equivalence point.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 19.02 mg of C₁₆H₂₅N₂NaO₅S.

STORAGE

Store in an airtight container, at a temperature not exceeding 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. (Z)-7-[(RS)-[(R)-2-amino-2-carboxyethyl]sulphonyl]-2-[[[(1S)-2,2-dimethylcyclopropyl]carbonyl]amino]hept-2-enoic acid,

- B. R = H: (Z)-7-[[[(R)-2-[[[(1S)-1-methyl-3-oxobutyl]amino]-2-carboxyethyl]sulphonyl]-2-[[[(1S)-2,2-dimethylcyclopropyl]carbonyl]amino]hept-2-enoic acid,
- C. R = CH₃: (Z)-7-[[[(R)-2-[(1,1-dimethyl-3-oxobutyl)amino]-2-carboxyethyl]sulphonyl]-2-[[[(1S)-2,2-dimethylcyclopropyl]carbonyl]amino]hept-2-enoic acid,

- D. 4-methylpent-3-en-2-one (mesityl oxide).

corrected

CILAZAPRIL

Cilazaprilum

C₂₂H₃₁N₃O₅·H₂O

M_r 435.5

DEFINITION

Cilazapril contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (1S,9S)-9-[[[(1S)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6H-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in methanol and in methylene chloride.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cilazapril CRS*.
- B. It complies with the test for specific optical rotation (see Tests).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.200 g in 0.067 M phosphate buffer solution pH 7.0 R, with the aid of ultrasound if necessary and dilute to 50.0 ml with the same buffer solution. The specific optical rotation is –383 to –399, determined at 365 nm and calculated with reference to the anhydrous substance.

Impurity A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *cilazapril impurity A CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *cilazapril impurity A CRS* and 5 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *glacial acetic acid R*, 5 volumes of *water R*, 15 volumes of *hexane R*, 15 volumes of *methanol R* and 60 volumes of *ethyl acetate R*. Dry the plate in a current of cold air for 10 min. Spray the plate with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution R* and 10 volumes of *dilute acetic acid R* and then with *dilute hydrogen peroxide solution R*. Any spot corresponding to impurity A in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Other related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *cilazapril impurity D CRS* in the test solution and dilute to 10.0 ml with the same solution.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 10 volumes of *triethylamine R* and 750 volumes of *water R*, adjust to pH 2.30 with *phosphoric acid R*, and add 200 volumes of *tetrahydrofuran R*,
- as detector a spectrophotometer set at 214 nm.

Inject 20 µl of reference solution (a) and 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to cilazapril and impurity D in the chromatogram obtained with reference solution (b) is at least 2.5 and the symmetry factor of the peak due to cilazapril is not more than 3.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for twice the retention time of the principal peak. When impurity A is present (relative retention time of 4 to 5), it may be necessary to continue the chromatography until it is eluted. When the chromatograms are recorded in the prescribed conditions, the retention times relative to cilazapril are: impurity B about 0.6; impurity D about 0.9; impurity C about 1.6. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity D is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the area of any peak corresponding to impurity B is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of any peak corresponding to impurity C is not greater than 0.2 times the area of the principal peak in the chromatogram

01/2005:0756

obtained with reference solution (a) (0.1 per cent); the area of any peak, apart from the principal peak and the peaks corresponding to impurities B, C and D, is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (a) and any peak due to impurity A.

Water (2.5.12): 3.5 per cent to 5.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 10 ml of *ethanol R* and add 50 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 41.75 mg of $C_{10}H_{16}N_6S$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. $R = C(CH_3)_3$, $R' = C_6H_5$: 1,1-dimethylethyl (1*S*,9*S*)-9-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6*H*-pyridazino[1,2-*a*][1,2]diazepine-1-carboxylate,

B. $R = R' = H$: (1*S*,9*S*)-9-[(*S*)-1-carboxy-3-phenylpropyl]amino]-10-oxooctahydro-6*H*-pyridazino[1,2-*a*][1,2]diazepine-1-carboxylic acid,

C. $R = R' = C_2H_5$: ethyl (1*S*,9*S*)-9-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6*H*-pyridazino[1,2-*a*][1,2]diazepine-1-carboxylate,

D. (1*S*,9*S*)-9-[(*R*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-10-oxooctahydro-6*H*-pyridazino[1,2-*a*][1,2]diazepine-1-carboxylic acid.

CIMETIDINE

Cimetidinum

$C_{10}H_{16}N_6S$

M_r 252.3

DEFINITION

Cimetidine contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-cyano-1-methyl-3-[2-[(5-methyl-1*H*-imidazol-4-yl)methyl]sulphonyl]ethyl]guanidine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute mineral acids.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Melting point (2.2.14): 139 °C to 144 °C. If necessary, dissolve the substance to be examined in 2-propanol *R*, evaporate to dryness and determine the melting point again.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cimetidine CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in 2-propanol *R*, evaporate to dryness and record the spectra again.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (d).
- Dissolve about 1 mg in a mixture of 1 ml of *ethanol R* and 5 ml of a freshly prepared 20 g/l solution of *citric acid R* in *acetic anhydride R*. Heat in a water-bath for 10 min to 15 min. A reddish-violet colour develops.

TESTS

Appearance of solution. Dissolve 3.0 g in 12 ml of 1 M *hydrochloric acid* and dilute to 20 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*. Dilute 20 ml of this solution to 100 ml with *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methanol R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *methanol R*.

01/2005:1500

Reference solution (d). Dissolve 10 mg of *cimetidine CRS* in 2 ml of *methanol R*.

A. Apply separately to the plate 4 µl of each solution. Allow the plate to stand for 15 min in the chromatographic tank saturated with vapour from the mobile phase which consists of a mixture of 15 volumes of *concentrated ammonia R*, 20 volumes of *methanol R* and 65 volumes of *ethyl acetate R* and develop immediately over a path of 15 cm using the same mixture of solvents. Dry the plate in a stream of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and not more than two such spots are more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows a clearly visible spot.

B. Apply separately to the plate 4 µl of each solution. Develop over a path of 15 cm using a mixture of 8 volumes of *concentrated ammonia R*, 8 volumes of *methanol R* and 84 volumes of *ethyl acetate R*. Dry the plate in a stream of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and not more than two such spots are more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows a clearly visible spot.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.23 mg of $C_{10}H_{16}N_6S$.

STORAGE

Store in an airtight container, protected from light.

CIMETIDINE HYDROCHLORIDE

Cimetidini hydrochloridum

 $C_{10}H_{17}ClN_6S$
 M_r 288.8

DEFINITION

Cimetidine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-cyano-1-methyl-3-[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]guanidine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, sparingly soluble in ethanol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Dissolve 70 mg in 0.2 M *sulphuric acid* and dilute to 100.0 ml with the same acid. Dilute 2.0 ml of the solution to 100.0 ml with 0.2 M *sulphuric acid*. Measure the absorbance (2.2.25) at the absorption maximum at 218 nm. The specific absorbance at the maximum is 650 to 705.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cimetidine hydrochloride CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (d).
- Dissolve about 1 mg in a mixture of 1 ml of *ethanol R* and 5 ml of a freshly prepared 20 g/l solution of *citric acid R* in *acetic anhydride R*. Heat on a water-bath for 10 min to 15 min. A reddish-violet colour develops.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 3.0 g in 12 ml of 1 M *hydrochloric acid* and dilute to 20 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

pH (2.2.3). Dissolve 100 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent. The pH of the solution is 4.0 to 5.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 2 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methanol R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *cimetidine hydrochloride CRS* in 2 ml of *methanol R*.

A. Apply to the plate 4 µl of each solution. Allow the plate to stand for 15 min in a chromatographic tank saturated with vapour from the mobile phase, which consists of a mixture of 15 volumes of *concentrated ammonia R*, 20 volumes of *methanol R* and 65 volumes of *ethyl acetate R*, and develop immediately over a path of 15 cm using the same mixture of solvents. Dry the plate in a stream of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and at most two such spots are more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows a clearly visible spot.

B. Apply to the plate 4 µl of each solution. Develop over a path of 15 cm using a mixture of 8 volumes of *concentrated ammonia R*, 8 volumes of *methanol R* and 84 volumes of *ethyl acetate R*. Dry the plate in a stream of cold air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and at most two such spots are more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows a clearly visible spot.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g of the substance to be examined in a mixture of 5 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 28.88 mg of $C_{10}H_{17}ClN_3O_2$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. R1 = CN, R2 = SCH₃: 3-cyano-2-methyl-1-[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]isothiourea,
 B. R1 = CN, R2 = OCH₃: 3-cyano-2-methyl-1-[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]isourea,
 C. R1 = CONH₂, R2 = NHCH₃: 1-[(methylamino)[[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]amino]methylene]urea,
 D. R1 = H, R2 = NHCH₃: 1-methyl-3-[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]guanidine,

- E. 2-cyano-1-methyl-3-[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]guanidine,

- F. 2-cyano-1,3-bis[2-[(5-methyl-1H-imidazol-4-yl)methyl]sulphanyl]ethyl]guanidine.

01/2005:1088

CINCHOCAINE HYDROCHLORIDE

Cinchocaini hydrochloridum

$C_{20}H_{30}ClN_3O_2$

M_r 379.9

DEFINITION

Cinchocaine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-butoxy-N-[2-(diethylamino)ethyl]quinoline-4-carboxamide hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in acetone, in alcohol and in methylene chloride. It agglomerates very easily.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 60.0 mg in 1 M hydrochloric acid and dilute to 100 ml with the same acid. Dilute 2 ml of the solution to 100 ml with 1 M hydrochloric acid. Examined between 220 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 246 nm and 319 nm. The ratio of the absorbance measured at 246 nm to that measured at 319 nm is 2.7 to 3.0.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cinchocaine hydrochloride CRS*. Examine the substances prepared as discs using *potassium chloride R*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve 0.5 g in 5 ml of *water R*. Add 1 ml of *dilute ammonia R2*. A white precipitate is formed. Filter, wash the precipitate with five quantities, each of 10 ml, of *water R* and dry in a desiccator. It melts at 64 °C to 66 °C (2.2.14).
- E. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

pH (2.2.3). Dilute 10 ml of solution S to 50 ml with *carbon dioxide-free water R*. The pH of the solution is 5.0 to 6.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *cinchocaine hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 50 ml with *methanol R*.

Reference solution (d). Dissolve 20 mg of *benzocaine CRS* in *methanol R* and dilute to 5 ml with the same solvent. Dilute 1 ml of the solution and 1 ml of reference solution (a) to 20 ml with *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *ammonia R*, 5 volumes of *methanol R*, 30 volumes of *acetone R* and 50 volumes of *toluene R*. Dry the plate in a current of warm air for 15 min. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 0.500 g by drying *in vacuo* at 60 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 15.0 ml of 0.01 M hydrochloric acid and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 37.99 mg of $C_{20}H_{30}ClN_3O_2$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. $R1 = Cl$, $R2 = NH-[CH_2]_2-N(C_2H_5)_2$: 2-chloro-*N*-[2-(diethylamino)ethyl]quinoline-4-carboxamide,
- B. $R1 = R2 = OH$: 2-hydroxyquinoline-4-carboxylic acid,
- C. $R1 = OH$, $R2 = NH-[CH_2]_2-N(C_2H_5)_2$: *N*-[2-(diethylamino)ethyl]-2-hydroxyquinoline-4-carboxamide,
- D. $R1 = O-[CH_2]_3-CH_3$, $R2 = OH$: 2-butoxyquinoline-4-carboxylic acid.

01/2005:0174

CINCHONA BARK

Cinchonae cortex

DEFINITION

Whole or cut, dried bark of *Cinchona pubescens* Vahl (*Cinchona succirubra* Pavon), of *C. calisaya* (Weddell), of *C. ledgeriana* (Moens ex Trimen) or of its varieties or hybrids.

Content: minimum 6.5 per cent of total alkaloids, of which 30 per cent to 60 per cent consists of quinine-type alkaloids (dried drug).

CHARACTERS

Intense bitter, somewhat astringent taste.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The stem and branch bark is supplied in quilled or curved pieces 2 mm to 6 mm thick. The outer surface is dull brownish-grey or grey and frequently bears lichens; it is usually rough, marked with transverse fissures and longitudinally furrowed or wrinkled; exfoliation of the outer surface occurs in some varieties. The inner surface is striated and deep reddish-brown; the fracture is short in the outer part and fibrous in the inner part.

- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: thin-walled cork cells filled with reddish-brown contents; yellow, spindle-shaped striated phloem fibres up to 90 µm in diameter and up to 1300 µm in length, very thick-walled with an uneven lumen and with conspicuous, funnel-shaped pits; parenchymatous idioblasts filled with microprisms of calcium oxalate. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows a few starch granules 6 µm to 10 µm in diameter; mostly simple but occasionally with 2 or 3 components.

C. Thin-layer chromatography (2.2.27).

Test solution. To 0.10 g of the powdered drug (180) in a test-tube add 0.1 ml of *concentrated ammonia R* and 5 ml of *methylene chloride R*. Shake vigorously occasionally during 30 min and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 1 ml of *ethanol R*.

Reference solution. Dissolve 17.5 mg of *quinine R*, 2.5 mg of *quinidine R*, 10 mg of *cinchonine R* and 10 mg of *cinchonidine R* in 5 ml of *ethanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *diethylamine R*, *ethyl acetate R*, *toluene R* (10:20:70 *V/V/V*).

Application: 10 µl, as bands.

Development: twice over a path of 15 cm.

Drying: at 100-105 °C then allow to cool.

Detection A: spray with *anhydrous formic acid R* and allow to dry in air. Examine in ultraviolet light at 365 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Quinidine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinidine)
Quinine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinine)
Reference solution	Test solution

Detection B: spray with *iodoplatinate reagent R*.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Cinchonine: a violet zone which becomes violet-grey	A violet zone, which becomes violet-grey (cinchonine)
Quinidine: a violet zone which becomes violet-grey	A violet zone, which becomes violet-grey (quinidine)
Cinchonidine: an intense dark blue zone	An intense dark blue zone (cinchonidine)
Quinine: a violet zone which becomes violet-grey	A violet zone, which becomes violet-grey (quinine)
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 2 per cent *m/m*.

Total ash (2.4.16): maximum 6.0 per cent.

Loss on drying (2.2.32): maximum 10 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

ASSAY

Test solution. In a 250 ml conical flask mix 1.000 g of the powdered drug (180) with 10 ml of *water R* and 7 ml of *dilute hydrochloric acid R*. Heat in a water-bath for 30 min, allow to cool and add 25 ml of *methylene chloride R*, 50 ml of *ether R* and 5 ml of a 200 g/l solution of *sodium hydroxide R*. Shake the mixture repeatedly for 30 min, add 3 g of powdered *tragacanth R* and shake until the mixture becomes clear. Filter through a plug of absorbent cotton and rinse the flask and the cotton with 5 quantities, each of 20 ml, of a mixture of 1 volume of *methylene chloride R* and 2 volumes of *ether R*. Combine the filtrate and washings, evaporate to dryness and dissolve the residue in 10.0 ml of *ethanol R*. Evaporate 5.0 ml of the solution to dryness, dissolve the residue in 0.1 *M* *hydrochloric acid* and dilute to 1000.0 ml with the same acid.

Reference solutions. Dissolve separately 30.0 mg of *quinine R* and 30.0 mg of *cinchonine R* in 0.1 *M* *hydrochloric acid* and dilute each solution to 1000.0 ml with the same acid.

Measure the absorbances (2.2.25) of the 3 solutions at 316 nm and 348 nm using 0.1 *M* *hydrochloric acid* as the compensation liquid.

Calculate the percentage content of alkaloids from the following equations:

$$x = \frac{[A_{316} \times A_{348c}] - [A_{316c} \times A_{348}]}{[A_{316q} \times A_{348c}] - [A_{316c} \times A_{348q}]} \times \frac{100}{m} \times \frac{2}{1000}$$

$$y = \frac{[A_{316} \times A_{348q}] - [A_{316q} \times A_{348}]}{[A_{316c} \times A_{348q}] - [A_{316q} \times A_{348c}]} \times \frac{100}{m} \times \frac{2}{1000}$$

m = mass of the drug used, in grams,

x = percentage content of quinine-type alkaloids,

y = percentage content of cinchonine-type alkaloids,

*A*₃₁₆ = absorbance of the test solution at 316 nm,

*A*₃₄₈ = absorbance of the test solution at 348 nm,

*A*_{316c} = absorbance of the reference solution containing cinchonine at 316 nm, corrected to a concentration of 1 mg/1000 ml,

*A*_{316q} = absorbance of the reference solution containing quinine at 316 nm, corrected to a concentration of 1 mg/1000 ml,

*A*_{348c} = absorbance of the reference solution containing cinchonine at 348 nm, corrected to a concentration of 1 mg/1000 ml,

*A*_{348q} = absorbance of the reference solution containing quinine at 348 nm, corrected to a concentration of 1 mg/1000 ml.

Calculate the content of total alkaloids, (*x* + *y*), and the relative content of quinine-type alkaloids, from the following expression:

$$\frac{100x}{x + y}$$

CINEOLE

Cineolum

C₁₀H₁₈OM_r 154.3

DEFINITION

1,3,3-Trimethyl-2-oxabicyclo[2.2.2]octane.

CHARACTERS

Appearance: clear colourless liquid.*Solubility*: practically insoluble in water, miscible with alcohol and with methylene chloride.

It solidifies at about 0.5 °C.

IDENTIFICATION

A. It complies with the test for refractive index (see Tests).

B. Thin-layer chromatography (2.2.27).

Test solution. Dilute 1 ml of solution S (see Tests) to 25 ml with *alcohol R*.*Reference solution*. Mix 80 mg of *cineole CRS* with *alcohol R* and dilute to 10 ml with the same solvent.*Plate*: TLC silica gel plate *R*.*Mobile phase*: *ethyl acetate R*, *toluene R* (10:90 V/V).*Application*: 2 µl.*Development*: over 2/3 of the plate.*Drying*: in a current of cold air.*Detection*: spray with *anisaldehyde solution R*, heat at 100-105 °C for 5 min.*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.C. To 0.1 ml add 4 ml of *sulphuric acid R*. An orange-red colour develops. Add 0.2 ml of *formaldehyde solution R*. The colour changes to deep brown.

TESTS

Solution S. Dilute 2.00 g to 10.0 ml with *alcohol R*.**Appearance of solution**. Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).**Chiral impurities**. The optical rotation (2.2.7) of solution S is -0.10° to +0.10°.**Refractive index** (2.2.6): 1.456 to 1.460.**Related substances**. Gas chromatography (2.2.28).*Internal standard solution*. Dissolve 1.0 g of *camphor R* in *heptane R* and dilute to 200 ml with the same solvent.*Test solution (a)*. Dissolve 2.5 g of the substance to be examined in *heptane R* and dilute to 25.0 ml with the same solvent.*Test solution (b)*. Dissolve 2.5 g of the substance to be examined in *heptane R*, add 5.0 ml of the internal standard solution and dilute to 25.0 ml with *heptane R*.01/2005:1973 *Reference solution (a)*. To 2.0 ml of test solution (a) add 20.0 ml of the internal standard solution and dilute to 100.0 ml with *heptane R*.*Reference solution (b)*. Dissolve 50 mg of *1,4-cineole R* and 50 mg of the substance to be examined in *heptane R* and dilute to 50.0 ml with the same solvent.*Column*:– *size*: *l* = 30 m, Ø = 0.25 mm,– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).*Carrier gas*: *helium for chromatography R*.*Linear velocity*: 45 cm/s.*Split-ratio*: 1:70.*Temperature*:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 35	50 → 100
	35 - 45	100 → 200
	45 - 55	200
Injection port		220
Detector		250

Detection: flame ionisation.*Injection*: 1 µl.*System suitability*: reference solution (b):– *resolution*: minimum 10 between the peaks due to impurity A and to cineole.*Limits*:

- *total*: calculate the ratio (*R*) of the area of the peak due to cineole to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (a); from the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to internal standard: this ratio is not greater than *R* (2 per cent),
- *disregard limit*: 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Residue on evaporation: maximum 0.1 per cent.To 2.0 g add 5 ml of *water R*, evaporate to dryness on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 2 mg.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. 1-methyl-4-(1-methylethyl)-7-oxabicyclo[2.2.1]heptane (1,4-cineole).

01/2005:0387 ASSAY

CINNAMON**Cinnamomi cortex****DEFINITION**

Cinnamon consists of the dried bark, freed from the outer cork and the underlying parenchyma, of the shoots grown on cut stock of *Cinnamomum zeylanicum* Nees. It contains not less than 12 ml/kg of essential oil.

CHARACTERS

Cinnamon has a characteristic, aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The bark is about 0.2 mm to 0.8 mm thick and occurs in closely-packed compound quills made up of single or double quills. The outer surface is smooth, yellowish-brown with faint scars marking the position of leaves and axillary buds and has fine, whitish and wavy longitudinal striations. The inner surface is slightly darker and longitudinally striated. The fracture is short and fibrous.
- B. Reduce to a powder (355). The powder is yellowish to reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of rounded sclereids with pitted, channelled and moderately thickened walls; numerous colourless single fibres, often whole with narrow lumen and thickened, lignified walls and few pits; small acicular crystals of calcium oxalate. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*; the powder shows abundant starch granules. Cork fragments are absent or very rare.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
- Test solution.* Shake 0.1 g of powdered drug (500) with 2 ml of *methylene chloride R* for 15 min. Filter and evaporate the filtrate carefully almost to dryness on a water-bath. Dissolve the residue in 0.4 ml of *toluene R*.
- Reference solution.* Dissolve 50 µl of *cinnamic aldehyde R* and 10 µl of *eugenol R* in *toluene R* and dilute to 10 ml with the same solvent.
- Apply separately to the plate as bands 20 mm by 3 mm, 10 µl of each solution. Develop over a path of 10 cm using *methylene chloride R*. Allow the plate to dry in air, examine in ultraviolet light at 254 nm and mark the quenching zones. Examine the plate in ultraviolet light at 365 nm and mark the fluorescent zones. In ultraviolet light at 254 nm, the chromatograms obtained with the test and reference solutions show a quenching zone (cinnamaldehyde) in the median part and just above it a weaker quenching zone (eugenol). In ultraviolet light at 365 nm, the chromatogram obtained with the test solution shows a zone of light-blue fluorescence (*o*-methoxy-cinnamaldehyde) just below the zone corresponding to cinnamaldehyde. Spray with *phloroglucinol solution R*. The zone corresponding to cinnamaldehyde is yellowish-brown and the zone corresponding to *o*-methoxycinnamaldehyde is violet.

TESTS

Total ash (2.4.16). Not more than 6.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml flask, 200 ml of 0.1 M *hydrochloric acid* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Powder the drug (710) and proceed immediately with the determination, using 20.0 g. Distil at a rate of 2.5-3.5 ml/min for 3 h.

STORAGE

Store protected from light.

01/2005:1501

CINNAMON BARK OIL, CEYLON**Cinnamomi zeylanicii corticis aetheroleum****DEFINITION**

Ceylon cinnamon bark oil is obtained by steam distillation of the bark of the shoots of *Cinnamomum zeylanicum* Nees (*C. Verum* J.S. Presl.).

CHARACTERS

A clear, mobile, light yellow liquid becoming reddish over time, with a characteristic odour reminiscent of cinnamic aldehyde.

IDENTIFICATION

First identification: B.

Second identification: A.

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 1 ml of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 µl of *trans-cinnamic aldehyde R*, 10 µl of *eugenol R*, 10 µl of *linalol R* and 10 µl of *β-caryophyllene R* in *alcohol R* and dilute to 10 ml with the same solvent.

Apply to the plate, as bands, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *toluene R*. Allow the plate to dry in air and spray with *anisaldehyde solution R*. Examine in daylight while heating at 100-105 °C for 5-10 min. The chromatogram obtained with the test solution shows zones similar in position and colour to those in the chromatogram obtained with the reference solution.

- B. Examine the chromatograms obtained in the test for chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with the test solution are similar to those in the chromatogram obtained with the reference solution. Safrole, coumarin and cineole may be absent from the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 1.000 to 1.030.

Refractive index (2.2.6): 1.572 to 1.591.

Optical rotation (2.2.7): -2° to +1°.

Chromatographic profile. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. Dissolve 10 µl of *cineole R*, 10 µl of *linalol R*, 10 µl of *β-caryophyllene R*, 10 µl of *safrole R*, 100 µl of *trans-cinnamic aldehyde R*, 10 µl of *eugenol R*, 20 mg of *coumarin R*, 10 µl of *trans-2-methoxycinnamaldehyde R* and 10 µl of *benzyl benzoate R* in 1 ml of *acetone R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 60 m long and about 0.25 mm in internal diameter coated with *macrogol 20 000 R* as the bonded phase,
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 10	60	–	isothermal
	10 - 75	60 → 190	2	linear gradient
	75 - 200	190	–	isothermal
Injection port		200		
Detector		240		

Inject 0.2 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Depending on the operating conditions and the state of the column, coumarin may elute before or after *trans-2-methoxycinnamaldehyde*. Record the retention times of these substances.

The test is not valid unless the resolution between the peaks corresponding to linalol and *β-caryophyllene* is at least 1.5.

Inject 0.2 µl of the test solution. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Determine the percentage content of each of these components by the normalisation procedure.

The percentages are within the following ranges:

- *cineole*: less than 3.0 per cent,
- *linalol*: 1.0 per cent to 6.0 per cent,
- *β-caryophyllene*: 1.0 per cent to 4.0 per cent,
- *safrole*: less than 0.5 per cent,
- *trans-cinnamic aldehyde*: 55 per cent to 75 per cent,
- *eugenol*: less than 7.5 per cent,
- *coumarin*: less than 0.5 per cent,
- *trans-2-methoxycinnamaldehyde*: 0.1 per cent to 1.0 per cent,
- *benzyl benzoate*: less than 1.0 per cent.

STORAGE

Store in a well-filled, airtight container, protected from light and heat.

01/2005:1608

CINNAMON LEAF OIL, CEYLON

Cinnamomi zeylanici folii aetheroleum

DEFINITION

Oil obtained by steam distillation of the leaves of *Cinnamomum verum* J.S. Presl.

CHARACTERS

Clear, mobile, reddish-brown to dark brown liquid, with a characteristic odour reminiscent of eugenol.

IDENTIFICATION

First identification: *B*.

Second identification: *A*.

A. Thin-layer chromatography (2.2.27).

Test solution. Dilute 1 ml of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute about 50 µl of *trans-cinnamic aldehyde R*, 10 µl of *eugenol R*, 10 µl of *linalol R* and 10 µl of *β-caryophyllene R* in *alcohol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *methanol R*, *toluene R* (10:90 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Examine in day light while heating at 100-105 °C for 5-10 min.

Results: the zones in the chromatogram obtained with the test solution are similar in position and colour to those in the chromatogram obtained with the reference solution. The zone due to *trans-cinnamic aldehyde* may be very faint or absent.

B. Examine the chromatogram obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. The peaks corresponding to *cineole*, *safrole*, *trans-cinnamic aldehyde*, *cinnamyl acetate* and *coumarin* may be absent in the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 1.030 to 1.059.

Refractive index (2.2.6): 1.527 to 1.540.

Optical rotation (2.2.7): –2.5° to +2.0°.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution. Dissolve 10 µl of *cineole R*, 10 µl of *linalol R*, 10 µl of *β-caryophyllene R*, 10 µl of *safrole R*, 10 µl of *trans-cinnamic aldehyde R*, 10 µl of *cinnamyl acetate R*, 100 µl of *eugenol R* and 10 mg of *coumarin R* in 1 ml of *acetone R*.

Column:

- **material:** fused silica,
- **size:** *l* = 60 m, Ø = 0.25 mm,
- **stationary phase:** *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 1/100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	45
	10 - 78	45 → 180
	78 - 88	180
Injection port		200
Detector		240

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: the order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- **resolution:** minimum of 1.5 between the peaks due to linalol and β-caryophyllene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The percentages are within the following ranges:

- **cineole:** less than 1.0 per cent,
- **linalol:** 1.5 per cent to 3.5 per cent,
- **β-caryophyllene:** 1.5 per cent to 7.0 per cent,
- **safrole:** less than 3.0 per cent,
- **trans-cinnamic aldehyde:** less than 3.0 per cent,
- **cinnamyl acetate:** less than 2.0 per cent,
- **eugenol:** 70 per cent to 85 per cent,
- **coumarin:** less than 1.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light and heat.

01/2005:1819

CINNAMON TINCTURE**Cinnamomi corticis tinctura****DEFINITION**

Tincture produced from *Cinnamon* (0387).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (70 per cent V/V) by an appropriate procedure.

CHARACTERS

Appearance: clear, brownish-red liquid, with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. Place 10 ml of the tincture to be examined, 10 ml of *saturated sodium chloride solution R* and 5 ml of *toluene R* in a ground glass-stoppered tube. Shake for 2 min and centrifuge for 10 min. Use the organic layer.

Reference solution. Dissolve 5 µl of *eugenol R*, 25 µl of *trans-cinnamic aldehyde R* and 5 µl of *trans-2-methoxycinnamaldehyde R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate *R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
<i>Trans</i> -2-methoxycinnamaldehyde: a light blue fluorescent zone	A light blue fluorescent zone (<i>trans</i> -2-methoxycinnamaldehyde)
	A greenish fluorescent zone (above the starting line)
Reference solution	Test solution

Detection B: spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R*. Examine in daylight while heating at 100-105 °C for 5-10 min.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Eugenol: a blue zone	A blue zone (eugenol)
<i>Trans</i> -cinnamic aldehyde: a blue zone	A blue zone (<i>trans</i> -cinnamic aldehyde)
<i>Trans</i> -2-methoxycinnamaldehyde: an orange-brown zone (the colour fades away)	A weak orange-brown zone (<i>trans</i> -2-methoxycinnamaldehyde)
	2 or 3 blue zones above the starting line
Reference solution	Test solution

TESTS

Ethanol (2.9.10): 64 per cent V/V to 70 per cent V/V.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent V/V of methanol and maximum 0.05 per cent V/V of 2-propanol.

Dry residue (2.8.16): minimum 1.5 per cent *m/m*, determined on 5.0 g.

01/2005:0816

CINNARIZINE**Cinnarizinium**C₂₆H₂₈N₂M_r 368.5

DEFINITION

Cinnarizine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*E*)-1-(diphenylmethyl)-4-(3-phenylprop-2-enyl)piperazine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in methylene chloride, soluble in acetone, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 118 °C to 122 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cinnarizine CRS*. Examine the substances prepared as discs.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.
- Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 20 ml with the same solvent.
- Reference solution (a).* Dissolve 10 mg of *cinnarizine CRS* in *methanol R* and dilute to 20 ml with the same solvent.
- Reference solution (b).* Dissolve 10 mg of *cinnarizine CRS* and 10 mg of *flunarizine dihydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.
- Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 20 volumes of 1 M *sodium chloride*, 30 volumes of *methanol R* and 50 volumes of *acetone R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.
- D. Dissolve 0.2 g of *anhydrous citric acid R* in 10 ml of *acetic anhydride R* in a water-bath at 80 °C and maintain the temperature of the water-bath at 80 °C for 10 min. Add about 20 mg of the substance to be examined. A purple colour develops.

TESTS

Appearance of solution. Dissolve 0.5 g in *methylene chloride R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Acidity or alkalinity. Suspend 0.5 g in 15 ml of *water R*. Boil for 2 min. Cool and filter. Dilute the filtrate to 20 ml with *carbon dioxide-free water R*. To 10 ml add 0.1 ml of *phenolphthalein solution R* and 0.25 ml of 0.01 M *sodium hydroxide*. The solution is pink. To 10 ml add 0.1 ml of *methyl red solution R* and 0.25 ml of 0.01 M *hydrochloric acid*. The solution is red.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 12.5 mg of *cinnarizine CRS* and 15.0 mg of *flunarizine dihydrochloride CRS* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 20.0 ml with *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min a gradient programme using the following conditions:

Mobile phase A. A 10 g/l solution of *ammonium acetate R*,

Mobile phase B. A 0.2 per cent V/V solution of *glacial acetic acid R* in *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 – 20	75 → 10	25 → 90	linear gradient
20 – 25	10	90	isocratic elution
25 – 30	75	25	switch to initial eluent composition
30 = 0	75	25	restart gradient

- as detector a spectrophotometer set at 230 nm.

Equilibrate the column for a least 30 min at the initial eluent composition.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder. If necessary, adjust the concentration of glacial acetic acid in mobile phase B to obtain a horizontal base-line in the chromatogram.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: cinnarizine about 11 min and flunarizine about 11.5 min. The test is not valid unless the resolution between the peaks corresponding to cinnarizine and flunarizine is at least 5.0. If necessary, adjust the time programme for the gradient elution.

Inject 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*. Add dilute hydrochloric acid *R* until dissolution is complete. Dilute to 20 ml with the same mixture of *water R* and *acetone R*. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using 10 ml of lead standard solution (1 ppm Pb) obtained by diluting lead standard solution (100 ppm Pb) *R* with the mixture of *water R* and *acetone R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

01/2005:2013

ASSAY

Dissolve 0.150 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *ethyl methyl ketone R*. Titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 18.43 mg of $C_{26}H_{28}N_2$.

STORAGE

Store protected from light.

IMPURITIES

A. 1-(diphenylmethyl)piperazine,

B. (Z)-1-(diphenylmethyl)-4-(3-phenylprop-2-enyl)piperazine,

C. (4-(diphenylmethyl)-1,1-bis[(E)-3-phenylprop-2-enyl]piperazinium chloride,

D. 1-(diphenylmethyl)-4-[(1RS,3E)-4-phenyl-1-[(E)-2-phenylethenyl]but-3-enyl]piperazine,

E. 1,4-bis(diphenylmethyl)piperazine.

CIPROFIBRATE

Ciprofibratum

 $C_{13}H_{14}Cl_2O_3$
 M_r 289.2

DEFINITION

2-[4-[(1RS)-2,2-Dichlorocyclopropyl]phenoxy]-2-methylpropanoic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: practically insoluble in water, freely soluble in anhydrous ethanol, soluble in toluene.

mp: about 115 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: ciprofibrate CRS.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₄ (2.2.2, Method II).

Dissolve 1.0 g in *anhydrous ethanol R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.125 g of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Reference solution (b). Dissolve the contents of a vial of *ciprofibrate for system suitability CRS* in 2.0 ml of a mixture of equal volumes of *acetonitrile R* and *water R*.

Column:

- *size:* $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase:

- *mobile phase A:* 1.36 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.2 with *phosphoric acid R*,
- *mobile phase B:* *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	75 → 30	25 → 70
30 - 40	30	70
40 - 42	30 → 75	70 → 25

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl.

Identification of impurities: use the chromatogram supplied with *ciprofibrate* for *system suitability CRS* to identify the peaks due to impurities A, B, C, D and E.

Relative retention with reference to ciprofibrate (retention time = about 18 min): impurity A = about 0.7; impurity B = about 0.8; impurity C = about 0.95; impurity D = about 1.3; impurity E = about 1.5.

System suitability: reference solution (b):

- **resolution:** baseline separation between the peaks due to impurity C and ciprofibrate.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity A by 2.3,
- **impurities A, C, D:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity B:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **impurity E:** not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total of other impurities:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides (2.4.4): maximum 350 ppm.

To 0.190 g add 20 ml of *water R* and treat in an ultrasonic bath for 8 min. Filter. 15 ml of the filtrate complies with the test.

Water (2.5.12): maximum 0.5 per cent, determined on 1.000 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 20 ml of *water R* and 40 ml of *anhydrous ethanol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 28.92 mg of $C_{17}H_{18}FN_3O_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

A. 2-(4-ethenylphenoxy)-2-methylpropanoic acid,

B. 4-[(1R)-2,2-dichlorocyclopropyl]phenol,

C. R = CH_2OH : 2-[4-[(1R)-2,2-dichlorocyclopropyl]phenoxy]-2-methylpropan-1-ol,

D. R = $CO-OCH_3$: methyl 2-[4-[(1R)-2,2-dichlorocyclopropyl]phenoxy]-2-methylpropanoate,

E. R = $CO-OC_2H_5$: ethyl 2-[4-[(1R)-2,2-dichlorocyclopropyl]phenoxy]-2-methylpropanoate.

01/2005:1089
corrected

CIPROFLOXACIN

Ciprofloxacinum

$C_{17}H_{18}FN_3O_3$

M_r 331.4

DEFINITION

1-Cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: almost white or pale yellow, crystalline powder, slightly hygroscopic.

Solubility: practically insoluble in water, very slightly soluble in ethanol and in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *ciprofloxacin CRS*.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY_5 (2.2.2, *Method II*).

Dissolve 0.25 g in 0.1 M *hydrochloric acid* and dilute to 20 ml with the same solvent.

Impurity A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 50 mg of the substance to be examined in *dilute ammonia R1* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 10 mg of *ciprofloxacin impurity A CRS* in a mixture of 0.1 ml of *dilute ammonia R1* and 90 ml of *water R* and dilute to 100 ml with *water R*. Dilute 2 ml of the solution to 10 ml with *water R*.

Plate: *TLC silica gel F₂₅₄ plate R*.

Application: 5 µl.

At the bottom of a chromatographic tank, place an evaporating dish containing 50 ml of *concentrated ammonia R*. Expose the plate to the ammonia vapour for 15 min in the closed tank. Withdraw the plate, transfer to a second chromatographic tank and proceed with development.

Mobile phase: acetonitrile *R*, concentrated ammonia *R*, methanol *R*, methylene chloride *R* (10:20:40:40 V/V/V/V).

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Limit:

- **impurity A:** any spot corresponding to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. To 25.0 mg of the substance to be examined add 0.2 ml of dilute phosphoric acid *R* and dilute to 50.0 ml with the mobile phase and treat in an ultrasonic bath until a clear solution is obtained.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 5.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of ciprofloxacin hydrochloride for peak identification CRS in the mobile phase and dilute to 10.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm;
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography *R* (5 μ m);
- **temperature:** 40 °C.

Mobile phase: mix 13 volumes of acetonitrile *R* and 87 volumes of a 2.45 g/l solution of phosphoric acid *R*, previously adjusted to pH 3.0 with triethylamine *R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 278 nm.

Injection: 50 μ l.

Run time: twice the retention time of ciprofloxacin.

Relative retention with reference to ciprofloxacin (retention time = about 9 min): impurity E = about 0.4; impurity F = about 0.5; impurity B = about 0.6; impurity C = about 0.7; impurity D = about 1.2.

System suitability: reference solution (b):

- **resolution:** minimum 1.3 between the peaks due to impurity B and impurity C.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.7; impurity C = 0.6; impurity D = 1.4; impurity E = 6.7; use the chromatogram obtained with reference solution (b) and the type chromatogram supplied with the CRS to identify the corresponding peaks;
- **impurities B, C, D, E:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **any other impurity:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 0.5 g in dilute acetic acid *R* and dilute to 30 ml with the same solvent. Add 2 ml of water *R* instead of 2 ml

of buffer solution pH 3.5 *R*. The filtrate complies with limit test E. Prepare the standard using 10 ml of lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying under vacuum at 120 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 80 ml of glacial acetic acid *R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 33.14 mg of C₁₇H₁₈FN₃O₃.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F.

A. R = Cl: 7-chloro-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (fluoroquinolonic acid),

C. R = NH-(CH₂)₂-NH₂: 7-[(2-aminoethyl)amino]-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (ethylenediamine compound),

B. R = CO₂H, R' = H: 1-cyclopropyl-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid (desfluoro compound),

E. R = H, R' = F: 1-cyclopropyl-6-fluoro-7-(piperazin-1-yl)quinolin-4(1H)-one (decarboxylated compound),

F. R = CO₂H, R' = OH: 1-cyclopropyl-6-hydroxy-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid,

D. 7-chloro-1-cyclopropyl-4-oxo-6-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.

01/2005:0888 Limit:

CIPROFLOXACIN HYDROCHLORIDE

Ciprofloxacinum hydrochloridum

 $C_{17}H_{19}ClFN_3O_3$ M_r 367.8

DEFINITION

1-Cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid hydrochloride.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: pale yellow, crystalline powder, slightly hygroscopic.

Solubility: soluble in water, slightly soluble in methanol, very slightly soluble in ethanol, practically insoluble in acetone, in ethyl acetate and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: ciprofloxacin hydrochloride CRS.

B. 0.1 g gives reaction (b) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₅ (2.2.2, *Method II*).

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

pH (2.2.3): 3.5 to 4.5 for solution S.

Impurity A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 10 mg of ciprofloxacin impurity A CRS in a mixture of 0.1 ml of *dilute ammonia R1* and 90 ml of *water R* and dilute to 100 ml with *water R*. Dilute 2 ml of the solution to 10 ml with *water R*.

Plate: TLC silica gel F₂₅₄ plate R.

Application: 5 µl.

At the bottom of a chromatographic tank, place an evaporating dish containing 50 ml of *concentrated ammonia R*. Expose the plate to the ammonia vapour for 15 min in the closed tank. Withdraw the plate, transfer to a second chromatographic tank and proceed with development.

Mobile phase: acetonitrile R, concentrated ammonia R, methanol R, methylene chloride R (10:20:40:40 V/V/V/V).

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

– *impurity A:* any spot corresponding to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of ciprofloxacin hydrochloride CRS in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of ciprofloxacin hydrochloride for peak identification CRS in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm;
- *stationary phase:* base-deactivated octadecylsilyl silica gel for chromatography R (5 µm);
- *temperature:* 40 °C.

Mobile phase: mix 13 volumes of acetonitrile R and 87 volumes of a 2.45 g/l solution of phosphoric acid R, previously adjusted to pH 3.0 with triethylamine R.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 278 nm.

Injection: 50 µl.

Run time: twice the retention time of ciprofloxacin.

Relative retention with reference to ciprofloxacin (retention time = about 9 min): impurity E = about 0.4; impurity F = about 0.5; impurity B = about 0.6; impurity C = about 0.7; impurity D = about 1.2.

System suitability: reference solution (b):

- *resolution:* minimum 1.3 between the peaks due to impurity B and impurity C.

Limits:

- *correction factors:* for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.7; impurity C = 0.6; impurity D = 1.4; impurity E = 6.7; use the chromatogram obtained with reference solution (b) and the type chromatogram supplied with the CRS to identify the corresponding peaks;
- *impurities B, C, D, E:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *any other impurity:* not more than half the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *total:* not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *disregard limit:* 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 0.25 g in *water R* and dilute to 30 ml with the same solvent. Carry out the prefiltration. The filtrate complies with limit test E. Prepare the standard using 5 ml of *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): maximum 6.7 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: 10 µl; inject the test solution and reference solution (a).

Calculate the percentage content of $C_{17}H_{19}ClFN_3O_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F.

A. R = Cl: 7-chloro-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (fluoroquinolonic acid),

C. R = $NH-[CH_2]_2-NH_2$: 7-[(2-aminoethyl)amino]-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (ethylenediamine compound),

B. R = CO_2H , R' = H: 1-cyclopropyl-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid (desfluoro compound),

E. R = H, R' = F: 1-cyclopropyl-6-fluoro-7-(piperazin-1-yl)quinolin-4(1H)-one (decarboxylated compound),

F. R = CO_2H , R' = OH: 1-cyclopropyl-6-hydroxy-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid,

D. 7-chloro-1-cyclopropyl-4-oxo-6-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.

CISAPRIDE MONOHYDRATE

Cisapridum monohydricum

$C_{23}H_{29}ClFN_3O_4 \cdot H_2O$

M_r 484.0

DEFINITION

Cisapride monohydrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-5-chloro-*N*-[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in dimethylformamide, soluble in methylene chloride, sparingly soluble in methanol.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cisapride monohydrate CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methanol R*, evaporate to dryness in a current of air and record new spectra using the residues.

TESTS

Solution S. Dissolve 0.20 g in *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.1° to $+0.1^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *cisapride monohydrate CRS* and 40.0 mg of *haloperidol CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.2 ml/min:
Mobile phase A. A 20 g/l solution of *tetrabutylammonium hydrogen sulphate R*,
Mobile phase B. *Methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	80 → 55	20 → 45	linear gradient
20 - 21	55 → 5	45 → 95	switch to next step
21 - 25	5	95	isocratic
25 - 26	5 → 80	95 → 20	switch to initial eluent composition
26 - 30	80	20	re-equilibration
30 - 0	80	20	restart gradient

— as detector a spectrophotometer set at 275 nm.

Equilibrate the column with the initial mobile phase composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: cisapride about 15 min and haloperidol about 16 min. The test is not valid unless the resolution between the peaks due to cisapride and haloperidol is at least 2.5. If necessary, adjust the concentration of methanol in the mobile phase or adjust the time programme for the linear gradient.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak due to the solvent (blank) and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12): 3.4 per cent to 4.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.350 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 46.60 mg of $C_{27}H_{35}ClFN_3O_{10}$.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, B, C, E.

Other detectable impurities: D.

- A. R1 = R3 = H, R2 = OCH₃: 4-amino-5-chloro-2-methoxy-*N*[(3*RS*,4*SR*)-3-methoxy-1-(3-phenoxypropyl)piperidin-4-yl]benzamide,
- B. R1 = F, R2 = R3 = H: 4-amino-5-chloro-*N*[[1-[3-(4-fluorophenoxy)propyl]piperidin-4-yl]-2-methoxybenzamide,
- C. R1 = F, R2 = H, R3 = OCH₃: 4-amino-5-chloro-*N*[(3*RS*,4*RS*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide,
- E. R1 = F, R2 = OH, R3 = H: 4-amino-5-chloro-*N*[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-hydroxypiperidin-4-yl]-2-methoxybenzamide,

- D. 4-[(4-amino-5-chloro-2-methoxybenzoyl)amino]-5-chloro-*N*[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide.

01/2005:1503

CISAPRIDE TARTRATE

Cisapridi tartras

$C_{27}H_{35}ClFN_3O_{10}$

M_r 616.0

DEFINITION

Cisapride tartrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-5-chloro-*N*[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide (2*R*,3*R*)-2,3-dihydroxybutanedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, freely soluble in dimethylformamide, slightly soluble in methanol, very slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cisapride tartrate CRS*. Examine the substances prepared

as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness in a current of air and record new spectra using the residues.

- B. It complies with the test for specific optical rotation (see Tests).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.100 g in *methanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 5.0 to + 10.0, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of 10 volumes of *water R* and 90 volumes of *methanol R*, with gentle warming if necessary, and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *cisapride tartrate CRS* and 30.0 mg of *haloperidol CRS* in a mixture of 10 volumes of *water R* and 90 volumes of *methanol R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 10 volumes of *water R* and 90 volumes of *methanol R*. Dilute 5.0 ml of the solution to 20.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.2 ml/min:

Mobile phase A. A 20 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	80 → 55	20 → 45	linear gradient
20 - 21	55 → 5	45 → 95	switch to next step
21 - 25	5	95	isocratic
25 - 26	5 → 80	95 → 20	switch to initial eluent composition
26 - 30	80	20	re-equilibration
30 = 0	80	20	restart gradient

- as detector a spectrophotometer set at 275 nm.

Equilibrate the column with the initial mobile phase composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: cisapride about 15 min and haloperidol about 16 min. The test is not valid unless the resolution between the peaks due to cisapride and haloperidol is at least 2.5. If necessary, adjust the concentration of methanol in the mobile phase or adjust the time programme for the linear gradient.

Inject separately 10 µl of a mixture of 10 volumes of *water R* and 90 volumes of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the

chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to the solvent (blank) and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.500 g in 70 ml of *anhydrous acetic acid R* and titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 61.60 mg of $C_{27}H_{35}ClFN_3O_{10}$.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, C.

Other detectable impurities: B, D, E.

A. R1 = R3 = H, R2 = OCH₃: 4-amino-5-chloro-2-methoxy-*N*[(3*RS*,4*SR*)-3-methoxy-1-(3-phenoxypropyl)piperidin-4-yl]benzamide,

B. R1 = F, R2 = R3 = H: 4-amino-5-chloro-*N*[1-[3-(4-fluorophenoxy)propyl]piperidin-4-yl]-2-methoxybenzamide,

C. R1 = F, R2 = H, R3 = OCH₃: 4-amino-5-chloro-*N*[(3*RS*,4*RS*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide,

E. R1 = F, R2 = OH, R3 = H: 4-amino-5-chloro-*N*[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-hydroxypiperidin-4-yl]-2-methoxybenzamide.

D. 4-[(4-amino-5-chloro-2-methoxybenzoyl)amino]-5-chloro-*N*[(3*RS*,4*SR*)-1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide,

01/2005:0599

CISPLATIN**Cisplatinum**[PtCl₂(NH₃)₂]*M_r* 300.0**DEFINITION**

Cisplatin contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of *cis*-diamminedi-chloroplatinum (II).

CHARACTERS

A yellow powder or yellow or orange-yellow crystals, slightly soluble in water, sparingly soluble in dimethylformamide, practically insoluble in alcohol.

It decomposes with blackening at about 270 °C.

Carry out identification test B, the tests (except that for silver) and the assay protected from light.

IDENTIFICATION

First identification: A, B.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cisplatin CRS*. Examine the substances prepared as discs in *potassium bromide R*.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Add 50 mg to 2 ml of *dilute sodium hydroxide solution R* in a glass dish. Evaporate to dryness. Dissolve the residue in a mixture of 0.5 ml of *nitric acid R* and 1.5 ml of *hydrochloric acid R*. Evaporate to dryness. The residue is orange. Dissolve the residue in 0.5 ml of *water R* and add 0.5 ml of *ammonium chloride solution R*. A yellow, crystalline precipitate is formed.

TESTS

Solution S1. Dissolve 25 mg in a 9 g/l solution of *sodium chloride R* prepared with *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Solution S2. Dissolve 0.20 g in *dimethylformamide R* and dilute to 10 ml with the same solvent.

Appearance of solution S1. Solution S1 is clear (2.2.1) and not more intensely coloured than reference solution GY₅ (2.2.2, *Method II*).

Appearance of solution S2. Solution S2 is clear (2.2.1).

pH (2.2.3). The pH of solution S1, measured immediately after preparation, is 4.5 to 6.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R1* as the coating substance. Activate the plate by heating at 150 °C for 1 h.

Test solution (a). Dilute 1 ml of solution S2 to 10 ml with *dimethylformamide R*.

Test solution (b). Use solution S2.

Reference solution (a). Dissolve 10 mg of *cisplatin CRS* in 5 ml of *dimethylformamide R*.

Reference solution (b). Dilute 1 ml of solution S2 to 50 ml with *dimethylformamide R*.

Apply separately to the plate 2.5 µl of test solution (a), 2.5 µl of reference solution (a), 5 µl of test solution (b) and 5 µl of reference solution (b). Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of *dimethylformamide R*. Allow the plate to dry in air and spray with a 50 g/l solution of *stannous chloride R* in a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. After 1 h, the chromatogram obtained with test solution (b) shows no spot with an *R_f* value less than that of the principal spot and any spot with an *R_f* value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (b).

Silver. Not more than 250 ppm of Ag, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.100 g of the substance to be examined in 15 ml of *nitric acid R*, heating to 80 °C. Cool and dilute to 25.0 ml with *water R*.

Reference solutions. To suitable volumes (10 ml to 30 ml) of *silver standard solution (5 ppm Ag) R* add 50 ml of *nitric acid R* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 328 nm using a silver hollow-cathode lamp as source of radiation, a fuel-lean air-acetylene flame and, preferably, a spectral slit width of 0.5 nm. Carry out a blank determination.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a 9 g/l solution of *sodium chloride R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 50.0 mg of *cisplatin CRS* in a 9 g/l solution of *sodium chloride R* and dilute to 100.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *strong-anion-exchange silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture of 10 volumes of a 9 g/l solution of *sodium chloride R* and 90 volumes of *methanol R*,
- as detector a spectrophotometer set at 220 nm.

Use a sample loop. Inject separately 20 µl of the test solution and 20 µl of the reference solution.

STORAGE

Store in an airtight container, protected from light.

01/2005:0455

CITRIC ACID, ANHYDROUS**Acidum citricum anhydricum***C₆H₈O₇**M_r* 192.1**DEFINITION**

Anhydrous citric acid contains not less than 99.5 per cent and not more than the equivalent of 100.5 per cent of 2-hydroxypropane-1,2,3-tricarboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, colourless crystals or granules, very soluble in water, freely soluble in alcohol. It melts at about 153 °C with decomposition.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Dissolve 1 g in 10 ml of *water R*. The solution is strongly acidic (2.2.4).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *anhydrous citric acid CRS* after drying both the substance to be examined and the reference substance at 100-105 °C for 2 h.
- Add about 5 mg to a mixture of 1 ml of *acetic anhydride R* and 3 ml of *pyridine R*. A red colour develops.
- Dissolve 0.5 g in 5 ml of *water R*, neutralise using 1 M *sodium hydroxide* (about 7 ml), add 10 ml of *calcium chloride solution R* and heat to boiling. A white precipitate is formed.
- It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 2.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇, BY₇ or GY₇ (2.2.2, *Method II*).

Readily carbonisable substances. To 1.0 g in a cleaned test tube add 10 ml of *sulphuric acid R* and immediately heat the mixture in a water-bath at 90 ± 1 °C for 60 min. Immediately cool rapidly. The solution is not more intensely coloured than a mixture of 1 ml of red primary solution and 9 ml of yellow primary solution (2.2.2, *Method I*).

Oxalic acid. Dissolve 0.80 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules. Boil for 1 min. Allow to stand for 2 min. Transfer the supernatant liquid to a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of a 50 g/l solution of *potassium ferricyanide R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 0.1 g/l solution of *oxalic acid R* (360 ppm, calculated as anhydrous oxalic acid).

Sulphates (2.4.13). Dissolve 2.0 g in *distilled water R* and dilute to 30 ml with the same solvent. The solution complies with the limit test for sulphates (150 ppm).

Aluminium (2.4.17). If intended for use in the manufacture of dialysis solutions, it complies with the test for aluminium. Dissolve 20 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (0.2 ppm). Use as the reference solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Heavy metals (2.4.8). Dissolve 5.0 g in several portions in 39 ml of *dilute sodium hydroxide solution R* and dilute to 50 ml with *distilled water R*. 12 ml complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 2.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.550 g in 50 ml of *water R*. Titrate with 1 M *sodium hydroxide*, using 0.5 ml of *phenolphthalein solution R* as indicator.

1 ml of 1 M *sodium hydroxide* is equivalent to 64.03 mg of C₆H₈O₇.

LABELLING

The label states:

- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, that the substance is intended for use in the manufacture of dialysis solutions.

01/2005:0456

CITRIC ACID MONOHYDRATE

Acidum citricum monohydricum

C₆H₈O₇·H₂OM_r 210.1

DEFINITION

Citric acid monohydrate contains not less than 99.5 per cent and not more than the equivalent of 100.5 per cent of 2-hydroxypropane-1,2,3-tricarboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, colourless crystals or granules, efflorescent, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Dissolve 1 g in 10 ml of *water R*. The solution is strongly acidic (2.2.4).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *citric acid monohydrate CRS* after drying both the substance to be examined and the reference substance at 100-105 °C for 2 h.
- Add about 5 mg to a mixture of 1 ml of *acetic anhydride R* and 3 ml of *pyridine R*. A red colour develops.
- Dissolve 0.5 g in 5 ml of *water R*, neutralise using 1 M *sodium hydroxide* (about 7 ml), add 10 ml of *calcium chloride solution R* and heat to boiling. A white precipitate is formed.
- It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 2.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇, BY₇ or GY₇ (2.2.2, *Method II*).

01/2005:1609

CITRONELLA OIL

Citronellae aetheroleum

Readily carbonisable substances. To 1.0 g in a cleaned test tube add 10 ml of *sulphuric acid R* and immediately heat the mixture in a water-bath at 90 ± 1 °C for 60 min. Immediately cool rapidly. The solution is not more intensely coloured than a mixture of 1 ml of red primary solution and 9 ml of yellow primary solution (2.2.2, *Method I*).

Oxalic acid. Dissolve 0.80 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules. Boil for 1 min. Allow to stand for 2 min. Transfer the supernatant liquid to a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of a 50 g/l solution of *potassium ferricyanide R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 0.1 g/l solution of *oxalic acid R* (360 ppm, calculated as anhydrous oxalic acid).

Sulphates (2.4.13). Dissolve 2.0 g in *distilled water R* and dilute to 30 ml with the same solvent. The solution complies with the limit test for sulphates (150 ppm).

Aluminium (2.4.17). If intended for use in the manufacture of dialysis solutions, it complies with the test for aluminium. Dissolve 20 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (0.2 ppm). Use as the reference solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Heavy metals (2.4.8). Dissolve 5.0 g in several portions in 39 ml of *dilute sodium hydroxide solution R* and dilute to 50 ml with *distilled water R*. 12 ml complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): 7.5 per cent to 9.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.550 g in 50 ml of *water R*. Titrate with 1 M *sodium hydroxide*, using 0.5 ml of *phenolphthalein solution R* as indicator.

1 ml of 1 M *sodium hydroxide* is equivalent to 64.03 mg of $C_6H_8O_7$.

STORAGE

In an airtight container.

LABELLING

The label states:

- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, that the substance is intended for use in the manufacture of dialysis solutions.

DEFINITION

Oil obtained by steam distillation from the fresh or partially dried aerial parts of *Cymbopogon winterianus* Jowitt.

CHARACTERS

Pale yellow to brown-yellow liquid, with a very strong odour of citronellal.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dilute 0.1 g of citronella oil in 10.0 ml of *alcohol R*.

Reference solution. Dilute 20 µl of *citronellal R* in 10.0 ml of *alcohol R*.

Plate: TLC silica gel plate R.

Mobile phase: ethyl acetate R, toluene R (10:90 V/V).

Application: 5 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with anisaldehyde solution R and heat at 100–105 °C for 10 min. Examine in ultraviolet light at 365 nm.

Result: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Citronellal: a violet zone	A zone similar in colour to the citronellal zone An orange zone (citronellol-geraniol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Neral and geranial may be absent in the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 0.881 to 0.895.

Refractive index (2.2.6): 1.463 to 1.475.

Optical rotation (2.2.7): -4° to $+1.5^\circ$.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution. Dilute 25 µl of *limonene R*, 100 µl of *citronellal R*, 25 µl of *citronellyl acetate R*, 25 µl of *citral R*, 25 µl of *geranyl acetate R*, 25 µl of *citronellol R* and 100 µl of *geraniol R* in 5 ml of *hexane R*.

Column:

- *material:* fused silica,
- *size:* $l = 60$ m, $\varnothing = 0.25$ mm,
- *stationary phase:* *macrogol 20 000 R* (0.2 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	80
	2 - 26	80 → 150
	26 - 42	150 → 185
	42 - 49	185 → 250
Injection port		260
Detector		260

Detection: flame ionisation.

Injection: 1 µl of the reference solution, 0.2 µl of the test solution.

Elution order: the order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- resolution: minimum of 1.2 between the peaks due to geranyl acetate and citronellol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components.

The percentages are within the following values:

- limonene: 1.0 per cent to 5.0 per cent,
- citronellal: 30.0 per cent to 45.0 per cent,
- citronellyl acetate: 2.0 per cent to 4.0 per cent,
- neral: less than 2.0 per cent,
- geranial: less than 2.0 per cent,
- geranyl acetate: 3.0 per cent to 8.0 per cent,
- citronellol: 9.0 per cent to 15.0 per cent,
- geraniol: 20.0 per cent to 25.0 per cent.

STORAGE

In a well-filled container, protected from light.

01/2005:1651
corrected

CLARITHROMYCIN

Clarithromycinum

C₃₈H₆₉NO₁₃

M_r 748

DEFINITION

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-α-*L*-ribo-hexopyranosyl)oxy]-14-ethyl-12,13-dihydroxy-7-methoxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-β-*D*-xylo-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (6-*O*-methylerythromycin A).

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone and in methylene chloride, slightly soluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: clarithromycin CRS.

TESTS

Solution S. Dissolve 0.500 g in methylene chloride R and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear or not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, Method II).

Specific optical rotation (2.2.7): −94 to −102 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 75.0 mg of the substance to be examined in 25 ml of acetonitrile R1 and dilute to 50.0 ml with water R.

Reference solution (a). Dissolve 75.0 mg of clarithromycin CRS in 25 ml of acetonitrile R1 and dilute to 50.0 ml with water R.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of acetonitrile R1 and water R.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with a mixture of equal volumes of acetonitrile R1 and water R.

Reference solution (d). Dissolve 15.0 mg of clarithromycin for peak identification CRS in 5.0 ml of acetonitrile R1 and dilute to 10.0 ml with water R.

Blank solution. Dilute 25.0 ml of acetonitrile R1 to 50.0 ml with water R and mix.

Column:

- size: *l* = 0.10 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (3.5 µm),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: a 4.76 g/l solution of potassium dihydrogen phosphate R adjusted to pH 4.4 with dilute phosphoric acid R or a 45 g/l solution of potassium hydroxide R, filtered through a C18 filtration kit,
- mobile phase B: acetonitrile R1,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 32	75 → 40	25 → 60
32 - 34	40	60
34 - 36	40 → 75	60 → 25
36 - 42	75	25

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 10 µl; inject the blank solution, the test solution and reference solutions (b), (c) and (d).

Relative retention with reference to clarithromycin (retention time = about 11 min): impurity I = about 0.38; impurity A = about 0.42; impurity J = about 0.63; impurity L = about 0.74; impurity B = about 0.79; impurity M = about 0.81; impurity C = about 0.89; impurity D = about 0.96; impurity N = about 1.15; impurity E = about 1.27; impurity O = about 1.31; impurity F = about 1.33; impurity P = about 1.35; impurity K = about 1.59; impurity G = about 1.72; impurity H = about 1.82.

System suitability:

- *symmetry factor*: maximum 1.7 for the peak due to clarithromycin in the chromatogram obtained with reference solution (b),
- *peak-to-valley ratio*: minimum 3.0, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin in the chromatogram obtained with reference solution (d).

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity G = 0.27; impurity H = 0.15; use the chromatogram supplied with clarithromycin for peak identification CRS to identify the peaks;
- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), and not more than 4 such peaks have an area greater than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.4 per cent);
- *total*: not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.5 per cent);
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent); disregard the peaks eluting before impurity I and after impurity H.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *dioxan R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *dioxan R*.

Water (2.5.12): maximum 2.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 0.5 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{38}H_{69}NO_{13}$.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P.

- A. R1 = CH₃, R2 = OH, R3 = H: 2-demethyl-2-(hydroxymethyl)-6-*O*-methylerythromycin A (clarithromycin F),
 B. R1 = R2 = R3 = H: 6-*O*-methyl-15-norerythromycin A,
 P. R1 = R3 = CH₃, R2 = H: 4',6-di-*O*-methylerythromycin A,

- C. R1 = R2 = CH₃, R3 = H: 6-*O*-methylerythromycin A (*E*)-9-oxime,
 G. R1 = R2 = R3 = CH₃: 6-*O*-methylerythromycin A (*E*)-9-(*O*-methyloxime),
 J. R1 = CH₃, R2 = R3 = H: erythromycin A (*E*)-9-oxime,
 M. R1 = R3 = H, R2 = CH₃: 3'-*N*-demethyl-6-*O*-methylerythromycin A (*E*)-9-oxime,

- D. R1 = R2 = R3 = H: 3'-*N*-demethyl-6-*O*-methylerythromycin A,
 E. R1 = R2 = CH₃, R3 = H: 6,11-di-*O*-methylerythromycin A,
 F. R1 = R3 = CH₃, R2 = H: 6,12-di-*O*-methylerythromycin A,
 H. R1 = CHO, R2 = R3 = H: 3'-*N*-demethyl-3'-*N*-formyl-6-*O*-methylerythromycin A,

01/2005:1850

CLARY SAGE OIL

Salviae sclareae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh or dried flowering stems of *Salvia sclarea* L.

CHARACTERS

Appearance: colourless to brownish-yellow liquid, usually pale yellow, with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 1 ml of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 60 µl of *linalol R*, 200 µl of *linalyl acetate R* and 60 µl of α -terpineol *R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 5 µl of the test solution and 10 µl of the reference solution, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R* and heat at 100–105 °C for 5–10 min; examine in daylight within 5 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.

Top of the plate	
α -Terpineol: a dark violet zone	A dark violet zone
Linalyl acetate: a dark violet zone	A dark violet zone
Linalol: a dark violet zone	A dark violet zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the chromatogram obtained with the test solution shows 5 peaks similar in position to the 5 peaks in the chromatogram obtained with the reference solution. The 2 peaks corresponding to α - and β -thujone may be absent.

TESTS

Relative density (2.2.5): 0.890 to 0.908.

Refractive index (2.2.6): 1.456 to 1.466.

Optical rotation (2.2.7): -26° to -10° .

Acid value (2.5.1): maximum 1.0.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

I. 3-O-decladinosyl-6-O-methylerythromycin A,

K. (1*S*,2*R*,5*R*,6*S*,7*S*,8*R*,9*R*,11*Z*)-2-ethyl-6-hydroxy-9-methoxy-1,5,7,9,11,13-hexamethyl-8-[[3,4,6-trideoxy-3-(dimethylamino)- β -D-xylo-hexopyranosyl]oxy]-3,15-dioxabicyclo[10.2.1]pentadeca-11,13-dien-4-one (3-O-decladinosyl-8,9:10,11-dianhydro-6-O-methylerythromycin A-9,12-hemiketal,

L. R = H: 6-O-methylerythromycin A (*Z*)-9-oxime,

O. R = CH₃: 6-O-methylerythromycin A (*Z*)-9-(*O*-methyloxime),

N. (10*E*)-10,11-didehydro-11-deoxy-6-O-methylerythromycin A.

01/2005:1714

Reference solution. To 1 g of *hexane R*, add 5 µl of *thujone R*, 5 µl of *linalol R*, 100 µl of *linalyl acetate R*, 10 µl of *α-terpineol R* and 25 mg (± 20 per cent) of *sclareol R*. Mix thoroughly by stirring.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), $\varnothing = 0.25$ -0.53 mm,
- **stationary phase:** *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 120	190
Injection port		220
Detector		240

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- **resolution:** minimum 1.5 between the peaks due to linalol and linalyl acetate,

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution (disregard any peak due to hexane). *Thujone R* is a mixture of α - and β -thujone. α -Thujone elutes before β -thujone under the described conditions.

Determine the percentage content of each of these components.

Also determine the percentage content of *germacrene-D*. The *germacrene-D* peak can be identified in the chromatogram obtained with the test solution by its relative retention of 1.23 with reference to linalol under the described operating conditions.

The percentages are within the following ranges:

- α and β -thujone: less than 0.2 per cent,
- linalol: 6.5 per cent to 24 per cent,
- linalyl acetate: 56 per cent to 78 per cent,
- α -terpineol: less than 5.0 per cent,
- *germacrene-D*: 1.0 per cent to 12 per cent,
- *sclareol*: 0.4 per cent to 2.6 per cent.

STORAGE

In an airtight container, protected from light, at a temperature not exceeding 25 °C.

CLAZURIL FOR VETERINARY USE

Clazurilum ad usum veterinarium

$C_{17}H_{10}Cl_2N_4O_2$

M_r 373.2

DEFINITION

(2*RS*)-[2-Chloro-4-(3,5-dioxo-4,5-dihydro-1,2,4-triazin-2(3*H*)-yl)phenyl](4-chlorophenyl)acetonitrile.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or light yellow powder.

Solubility: practically insoluble in water, freely soluble in dimethylformamide, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

A. Melting point (2.2.14): 199 °C to 203 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of clazuril.*

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of equal volumes of *tetrahydrofuran R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5 mg of *clazuril for system suitability CRS* in a mixture of equal volumes of *tetrahydrofuran R* and *water R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *tetrahydrofuran R* and *water R*. Dilute 2.0 ml of this solution to 10.0 ml with a mixture of equal volumes of *tetrahydrofuran R* and *water R*.

Column:

- **size:** $l = 0.10$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (3 µm),
- **temperature:** 35 °C.

Mobile phase:

- **mobile phase A:** mix 100 volumes of a 7.7 g/l solution of *ammonium acetate R* adjusted to pH 6.2 with a 10 per cent V/V solution of *anhydrous formic acid R*, 150 volumes of *acetonitrile R* and 750 volumes of *water R*,
- **mobile phase B:** mix 100 volumes of a 7.7 g/l solution of *ammonium acetate R* adjusted to pH 6.2 with a 10 per cent V/V solution of *anhydrous formic acid R*, 850 volumes of *acetonitrile R* and 50 volumes of *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 0	0 → 100
20 - 25	0	100
25 - 30	0 → 100	100 → 0
30 - 40	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 5 µl.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to clazuril,
- the chromatogram obtained is concordant with the chromatogram supplied with *clazuril for system suitability CRS*.

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity G = 1.4; impurity H = 0.8;
- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent);
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peaks due to the solvents.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve about 0.260 g in 35 ml of *tetrahydrofuran R* and add 35 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 37.32 mg of $C_{17}H_{10}Cl_2N_4O_2$.

STORAGE

Protected from light.

IMPURITIES

- A. R = OH: (2RS)-[2-chloro-4-(3,5-dioxo-4,5-dihydro-1,2,4-triazin-2(3H)-yl)phenyl]-(4-chlorophenyl)acetic acid,

- C. R = NH₂: (2RS)-2-[2-chloro-4-(3,5-dioxo-4,5-dihydro-1,2,4-triazin-2(3H)-yl)phenyl]-2-(4-chlorophenyl)acetamide,

- I. (Z)-2-[[3-chloro-4-[(RS)-(4-chlorophenyl)cyanomethyl]phenyl]diazanylidene]acetamide.

01/2005:1303

CLEBOPRIDE MALATE

Clebopridi malas

DEFINITION

Clebopride malate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(1-benzylpiperidin-4-yl)-5-chloro-2-methoxybenzamide acid (*RS*)-2-hydroxybutanedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water and in methanol, slightly soluble in ethanol, practically insoluble in methylene chloride.

It melts at about 164 °C, with decomposition.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- Dissolve 20.0 mg in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *water R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 270 nm and 307 nm. The specific absorbances at the maxima are 252 to 278 and 204 to 226, respectively.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clebopride malate CRS*. Examine the substances prepared as discs.
- Dissolve 20 mg in 1 ml of *sulphuric acid R*, add 1 ml of *β-naphthol solution R1* and mix. The solution examined in daylight has a yellow colour with blue fluorescence.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 5 mg of the substance to be examined in *ethanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *clebopride malate CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *clebopride malate CRS* and 5 mg of *metoclopramide hydrochloride CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

Apply to the plate as bands 10 mm by 3 mm, 5 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *concentrated ammonia R*, 14 volumes of *acetone R*, 14 volumes of *methanol R* and 70 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal band in the chromatogram obtained with the test solution is similar in position and size to the principal band in the

chromatogram obtained with the reference solution (a). The identification is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated bands.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Examined immediately after preparation, solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

pH (2.2.3). The pH of solution S is 3.8 to 4.2.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *clebopride malate CRS* and 10.0 mg of *metoclopramide hydrochloride CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *acetonitrile R* and 80 volumes of a 1 g/l solution of *heptane sulphonate sodium R* adjusted to pH 2.5 with *phosphoric acid R*,
- as detector a spectrophotometer set at 215 nm.

Equilibrate the column with the mobile phase for 30 min. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the heights of the peaks in the chromatogram obtained are at least 30 per cent of the full scale of the recorder. The test is not valid unless the retention time of the second peak (clebopride) is about 15 min and the relative retention time of the first peak is about 0.45. Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and the two peaks eluting within 2 min, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all peaks, apart from the principal peak and the two peaks eluting within 2 min, is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Disregard any peak with an area less than 0.25 times that of the principal peak in the chromatogram obtained with reference solution (a).

Chlorides. Prepare the solutions at the same time.

Test solution. Dissolve 0.530 g of the substance to be examined in 20.0 ml of *anhydrous acetic acid R*, add 6 ml of *dilute nitric acid R* and dilute to 50.0 ml with *water R*.

Reference solution. To 1.5 ml of 0.001 M *hydrochloric acid*, add 20.0 ml of *anhydrous acetic acid R* and 6 ml of *dilute nitric acid R* and dilute to 50.0 ml with *water R*.

Transfer separately both solutions recently prepared to test tubes. Add to each tube 1 ml of *silver nitrate solution R2*. Allow to stand for 5 min protected from light. Examine the

01/2005:1190

tubes laterally against a black background. Any opalescence in the test solution is not more intense than that in the reference solution (100 ppm).

Sulphates. Prepare the solutions at the same time.

Test solution. Dissolve 3.00 g of the substance to be examined in 20.0 ml of *glacial acetic acid R*, heating gently if necessary. Allow to cool and dilute to 50.0 ml with *water R*.

Reference solution. To 9 ml of *sulphate standard solution (10 ppm SO₄) R1*, add 6 ml of *glacial acetic acid R*.

Into two test tubes introduce 1.5 ml of *sulphate standard solution (10 ppm SO₄) R1* and add 1 ml of a 250 g/l solution of *barium chloride R*. Shake and allow to stand for 1 min. To one of the tubes add 15 ml of the test solution and to the other one add 15 ml of the reference solution.

After 5 min, any opalescence in the tube containing the test solution is not more intense than that containing the reference solution (100 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 50.80 mg of C₂₄H₃₀ClN₃O₇.

STORAGE

Store protected from light.

IMPURITIES

A. 4-amino-5-chloro-2-methoxybenzoic acid,

B. 1-benzylpiperidin-4-amine,

C. 4-amino-N-(1-benzylpiperidin-4-yl)-2-methoxybenzamide.

CLEMASTINE FUMARATE

Clemastini fumaras

DEFINITION

Clemastine fumarate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-2-[2-[(*R*)-1-(4-chlorophenyl)-1-phenylethoxy]ethyl]-1-methylpyrrolidine (*E*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in alcohol (70 per cent V/V), slightly soluble in alcohol (50 per cent V/V) and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clemastine fumarate CRS*.
- Examine the chromatograms obtained in the test for related substances (see Tests). The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 50 mg of *fumaric acid CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *water R*, 25 volumes of *anhydrous formic acid R* and 70 volumes of *di-isopropyl ether R*. Dry the plate at 100 °C to 105 °C for 30 min, allow to cool and spray with a 16 g/l solution of *potassium permanganate R*. Examine in daylight. In the chromatogram obtained with test solution the spot with the highest *R_f* value is similar in position, colour and size to the spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 0.500 g of substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

pH (2.2.3). Suspend 1.0 g of the substance to be examined in 10 ml of *carbon dioxide-free water R*. The pH of the suspension is 3.2 to 4.2.

Specific optical rotation (2.2.7). The specific optical rotation is + 15.0 to + 18.0, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol R*.

Reference solution (a). Dissolve 20.0 mg of *clemastine fumarate CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.5 ml of test solution (b) to 50.0 ml with *methanol R*.

Reference solution (c). Dilute 0.5 ml of test solution (b) to 50.0 ml with *methanol R*.

Reference solution (d). Dissolve 10.0 mg of *diphenhydramine hydrochloride CRS* in 5.0 ml of reference solution (a).

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 20 volumes of *methanol R* and 80 volumes of *tetrahydrofuran R*. Dry the plate in a current of cold air for 5 min, spray with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution R* and 10 volumes of *dilute acetic acid R* and then with *dilute hydrogen peroxide solution R*. Cover the plate immediately with a glass plate of the same size and examine the chromatograms after 2 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent) and at most four such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent). Disregard any spot remaining at the starting point (fumaric acid). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

1-(4-Chlorophenyl)-1-phenylethanol. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (a). Dissolve 6 mg of *1-(4-chlorophenyl)-1-phenylethanol CRS* in a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R*.

Reference solution (c). Dissolve 10 mg of the substance to be examined in a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R* and dilute to 100 ml with the same mixture of solvents. To 1 ml of the solution add 1 ml of reference solution (a) and dilute to 100 ml with a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 0.1 volumes of *phosphoric acid R*, 45 volumes of *acetonitrile R* and 55 volumes of a 10 g/l solution of *ammonium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 220 nm.

Inject 100 µl of each solution. The test is not valid unless the resolution between the peaks due to clemastine and 1-(4-chlorophenyl)-1-phenylethanol in the chromatogram obtained with reference solution (c) is greater than 2.2. In the chromatogram obtained with the test solution: the area of any peak corresponding to 1-(4-chlorophenyl)-1-phenylethanol is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 6 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g of the substance to be examined in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 46.00 mg of $C_{25}H_{30}ClNO_5$.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D.

A. (1*RS*,2*R*)-2-[2-[(*R*)-1-(4-chlorophenyl)-1-phenylethoxy]ethyl]-1-methylpyrrolidine 1-oxide,

B. 4-[1-(4-chlorophenyl)-1-phenylethoxy]-1-methylazepane,

C. (*R*)-1-(4-chlorophenyl)-1-phenylethanol,

D. 2-[(*RS*)-1-methylpyrrolidin-2-yl]ethanol.

01/2005:1409

CLENBUTEROL HYDROCHLORIDE

Clenbuteroli hydrochloridum

$C_{12}H_{19}Cl_3N_2O$

M_r 313.7

DEFINITION

Clenbuterol hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-1-(4-amino-3,5-dichlorophenyl)-2-[(1,1-dimethylethyl)amino]ethanol hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water and in alcohol, slightly soluble in acetone.

It melts at about 173 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clenbuterol hydrochloride CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in 10 ml of *methanol R*.

Reference solution. Dissolve 10 mg of *clenbuterol hydrochloride CRS* in 10 ml of *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 0.15 volumes of *ammonia R*, 10 volumes of *ethanol R* and 15 volumes of *toluene R*. Allow the plate to dry in air. Spray with a 10 g/l solution of *sodium nitrite R* in 1 M *hydrochloric acid* and dip after 10 min in a 4 g/l solution of *naphthylethylenediamine dihydrochloride R* in *methanol R*. Allow the plate to dry in air. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in 10 ml of *carbon dioxide-free water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Optical rotation (2.2.7). Dissolve 0.30 g in *water R* and dilute to 10.0 ml with the same solvent. If necessary filter. The angle of optical rotation is −0.10° to +0.10°.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Disperse 100.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 0.1 ml of the test solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 10 mg of *clenbuterol impurity B CRS* in 20 ml of the mobile phase, add 5 ml of the test solution and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter, packed with *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.5 ml/min a mixture of 200 volumes of *acetonitrile R*, 200 volumes of *methanol R* and 600 volumes of a solution prepared as follows: dissolve 3.0 g of *sodium decanesulphonate R* and 5.0 g of *potassium dihydrogen phosphate R* in 900 ml of *water R*, adjust to pH 3.0 with *dilute phosphoric acid R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 215 nm, maintaining the temperature of the column at 40 °C.

Inject 5 µl of reference solution (a) and 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder. When the chromatogram are recorded in the prescribed conditions, the retention time of clenbuterol is about 11 min. The test is not valid until in the chromatogram obtained with reference solution (b) the resolution between the peaks corresponding to impurity B and clenbuterol is at least 2.5.

Inject 5 µl of the test solution and continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the peaks apart of the principal peak is not greater than 2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 1.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 31.37 mg of $C_{12}H_{19}Cl_3N_2O$.

IMPURITIES

- A. R1 = H, R2 = Cl: 4-amino-3,5-dichlorobenzaldehyde,
 B. R1 = CH₂-NH-C(CH₃)₃, R2 = Cl: 1-(4-amino-3,5-dichlorophenyl)-2-[(1,1-dimethylethyl)amino]ethanone (clenbuterol-ketone),
 C. R1 = CH₃, R2 = Cl: 1-(4-amino-3,5-dichlorophenyl)ethanone,
 D. R1 = CH₃, R2 = H: 1-(4-aminophenyl)ethanone,
 E. R1 = CH₂Br, R2 = Cl: 1-(4-amino-3,5-dichlorophenyl)-2-bromoethanone.

01/2005:0582

CLINDAMYCIN HYDROCHLORIDE

Clindamycini hydrochloridum

C₁₈H₃₄Cl₂N₂O₅SM_r 461.5

DEFINITION

Methyl 7-chloro-6,7,8-trideoxy-6-[[[(2S,4R)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-L-threo-α-D-galacto-octopyranoside hydrochloride. It contains a variable quantity of water.

Content: 84.0 per cent to 93.0 per cent of clindamycin (C₁₈H₃₃ClN₂O₅S) (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: clindamycin hydrochloride CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol* R and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *clindamycin hydrochloride* CRS in *methanol* R and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *clindamycin hydrochloride* CRS and 10 mg of *lincomycin hydrochloride* CRS in *methanol* R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: mix 19 volumes of 2-propanol R, 38 volumes of a 150 g/l solution of *ammonium acetate* R adjusted to pH 9.6 with *ammonia* R, and 43 volumes of *ethyl acetate* R.

Application: 5 µl.

Development: over a path of 15 cm using the upper layer of the mobile phase.

Drying: in air.

Detection: spray with a 1 g/l solution of *potassium permanganate* R.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 2 ml of *dilute hydrochloric acid* R and heat on a water-bath for 3 min. Add 3 ml of *sodium carbonate solution* R and 1 ml of a 20 g/l solution of *sodium nitroprusside* R. A violet-red colour develops.

D. Dissolve 0.1 g in *water* R and dilute to 10 ml with the same solvent. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 3.0 to 5.0.

Dissolve 1.0 g in *carbon dioxide-free water* R and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): + 135 to + 150 (anhydrous substance).

Dissolve 1.000 g in *water* R and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *clindamycin hydrochloride* CRS in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- **size:** *l* = 0.25 m, Ø = 4.6 mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 45 volumes of *acetonitrile* R and 55 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate* R adjusted to pH 7.5 with a 250 g/l solution of *potassium hydroxide* R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: twice the retention time of clindamycin.

System suitability: reference solution (a):

- **relative retentions** with reference to clindamycin (retention time = about 10 min): impurity A = about 0.4; impurity B = about 0.65; impurity C = about 0.8.

Limits:

- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),

- *impurity C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent),
- *any other impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent),
- *disregard limit*: 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): 3.0 per cent to 6.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: 20 µl; inject the test solution and reference solution (a).

System suitability: reference solution (a):

- *repeatability*: maximum relative standard deviation of 0.85 per cent for 6 replicate injections.

STORAGE

In an airtight container.

IMPURITIES

- R1 = CH₂-CH₂-CH₃, R2 = R4 = H, R3 = OH: methyl 6,8-dideoxy-6-[[[(2S,4R)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-erythro-α-D-galacto-octopyranoside (lincomycin),
- R1 = R3 = H, R2 = C₂H₅, R4 = Cl: methyl 7-chloro-6,7,8-trideoxy-6-[[[(2S,4S)-4-ethyl-1-methylpyrrolidin-2-yl]carbonyl]amino]-1-thio-L-threo-α-D-galacto-octopyranoside (clindamycin B),
- R1 = CH₂-CH₂-CH₃, R2 = R4 = H, R3 = Cl: methyl 7-chloro-6,7,8-trideoxy-6-[[[(2S,4R)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-erythro-α-D-galacto-octopyranoside (7-epiclindamycin).

01/2005:0996

CLINDAMYCIN PHOSPHATE

Clindamycini phosphas

C₁₈H₃₄ClN₂O₈PSM_r 505.0

DEFINITION

Clindamycin phosphate contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of methyl 7-chloro-6,7,8-trideoxy-6-[[[(2S,4R)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-L-threo-α-D-galacto-octopyranoside 2-(dihydrogen phosphate), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly hygroscopic, freely soluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared spectrophotometry (2.2.24), comparing with the spectrum obtained with *clindamycin phosphate CRS*. In two separate tubes place 50 mg of the substance to be examined and 50 mg of *clindamycin phosphate CRS*. Add 0.2 ml of *water R* and heat until completely dissolved. Evaporate to dryness under reduced pressure and dry at 100 °C to 105 °C for 2 h. Examine the substances prepared as discs using *potassium bromide R*.

- Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *clindamycin phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *lincomycin hydrochloride CRS* in 5 ml of reference solution (a).

Apply separately to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Dry the plate at 100 °C to 105 °C for 30 min and spray with a 1 g/l solution of *potassium permanganate R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two principal spots.

C. Dissolve about 10 mg in 2 ml of *dilute hydrochloric acid R* and heat in a water-bath for 3 min. Add 4 ml of *sodium carbonate solution R* and 1 ml of a 20 g/l solution of *sodium nitroprusside R*. Prepare a standard in the same manner using *clindamycin phosphate CRS*. The colour in the test solution corresponds to that in the standard.

D. Boil 0.1 g under a reflux condenser with a mixture of 5 ml of *strong sodium hydroxide solution R* and 5 ml of *water R* for 90 min. Cool and add 5 ml of *nitric acid R*. Extract with three quantities, each of 15 ml, of *methylene chloride R* and discard the extracts. Filter the upper layer through a paper filter. The filtrate gives reaction (b) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R*. Heat gently if necessary. Cool and dilute to 25.0 ml with *carbon dioxide-free water R*.

Appearance of the solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 5.0 ml of solution S to 20 ml with *carbon dioxide-free water R*. The pH of the solution is 3.5 to 4.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 115 to + 130, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29), as described under Assay. Inject reference solution (c). Adjust the sensitivity of the detector so that the height of the principal peak is not less than 50 per cent of the full scale of the recorder. Inject the test solution and continue the chromatography for the retention time of clindamycin: the area of any peak, apart from the principal peak and any peak due to the solvent, is not greater than 2.5 times the area of the peak corresponding to clindamycin phosphate in the chromatogram obtained with reference solution (c) (2.5 per cent) and the sum of the areas of all the peaks, apart from the principal peak and any peak due to the solvent, is not greater than four times the area of the peak corresponding to clindamycin phosphate in the chromatogram obtained with reference solution (c) (4.0 per cent). Disregard any peak with an area less than 10.0 per cent of that of the principal peak in the chromatogram obtained with reference solution (c).

Water (2.5.12). Not more than 6.0 per cent, determined on 0.250 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.6 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 75.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 75.0 mg of *clindamycin phosphate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *lincomycin hydrochloride CRS* and 15.0 mg of *clindamycin hydrochloride CRS* in 5.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 200 ml of *acetonitrile R* and 800 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R*, previously adjusted to pH 2.5 with *phosphoric acid R*,
- as detector a spectrophotometer set at 210 nm,
- a 20 µl loop injector.

Inject reference solution (b). Adjust the sensitivity of the detector so that the height of the peaks is not less than 50 per cent of the full scale of the recorder. The assay is not valid unless the first peak (lincomycin) is clearly separated from the solvent peak and the resolution between the second peak (clindamycin phosphate) and the third peak (clindamycin) is at least 6.0. Adjust the concentration of acetonitrile in the mobile phase, if necessary. The assay is not valid unless the symmetry factor of the clindamycin phosphate peak is at most 1.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for clindamycin phosphate is at most 1.0 per cent. If necessary adjust the integrator parameters. Inject alternately the test solution and reference solution (a).

Calculate the percentage content of clindamycin phosphate.

STORAGE

Store in an airtight container, at a temperature not exceeding 30 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. lincomycin,

B. R1 = PO₃H₂, R2 = R3 = H, R4 = C₂H₅: clindamycin B 2-(dihydrogen phosphate),

C. R1 = R3 = H, R2 = PO₃H₂, R4 = C₃H₇: clindamycin 3-(dihydrogen phosphate),

D. R1 = R2 = H, R3 = PO₃H₂, R4 = C₃H₇: clindamycin 4-(dihydrogen phosphate),

E. R1 = R2 = R3 = H, R4 = C₃H₇: clindamycin.

CLIOQUINOL

Clioquinolum

C₉H₅ClINOM_r 305.5

DEFINITION

5-Chloro-7-iodoquinolin-8-ol.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: almost white, light yellow, brownish-yellow or yellowish-grey powder.*Solubility*: practically insoluble in water, sparingly soluble in methylene chloride, very slightly soluble or slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.*Second identification*: A, C, D.

A. Dissolve 40.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml to 100.0 ml with *methanol R* (solution A). Examined between 280 nm and 350 nm (2.2.25), solution A shows an absorption maximum at 321 nm. Dilute 10.0 ml of solution A to 100.0 ml with *methanol R* (solution B). Examined between 230 nm and 280 nm, solution B shows an absorption maximum at 255 nm. The specific absorbance at this absorption maximum is 1530 to 1660.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of *potassium bromide R*.*Comparison*: *clioquinol CRS*.

C. When heated, violet fumes are produced.

D. Dissolve about 1 mg in 5 ml of *ethanol (96 per cent) R*. Add 0.05 ml of *ferric chloride solution R1*. A dark green colour develops.

TESTS

Acidity or alkalinity. Shake 0.5 g with 10 ml of *carbon dioxide-free water R* and filter. To the filtrate add 0.2 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent, heating gently if necessary. Dilute 10.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *5-chloroquinolin-8-ol R*, 10.0 mg of *5,7-dichloroquinolin-8-ol R*, 5 mg of the substance to be examined and 10.0 mg of *5,7-diiodoquinolin-8-ol R* in *methanol R*, heating gently if necessary and dilute to 20.0 ml with the same solvent. Dilute 4.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

01/2005:2111 *Reference solution (c).* Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 3.9$ mm,
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: dissolve 0.50 g of *sodium edetate R* in 350 ml of *water R*, add 4.0 ml of *hexylamine R* and mix. Adjust to pH 3.0 with *phosphoric acid R*. Add 600 ml of *methanol R* and dilute to 1000 ml with *water R*.

Flow rate: 1.3 ml/min.*Detection*: spectrophotometer at 254 nm.*Injection*: 20 μ l.*Run time*: 4 times the retention time of clioquinol.

Relative retention with reference to clioquinol (retention time = about 10 min): impurity A = about 0.4; impurity B = about 0.7; impurity C = about 1.3.

System suitability: reference solution (a):

- *resolution*: minimum 3.0 between the peaks due to clioquinol and impurity C.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *any other impurity*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *total of the nominal contents of impurities A, B, C and any other impurities*: maximum 3.0 per cent,
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Halides: maximum 140 ppm, expressed as chlorides.

Shake 0.5 g with 25 ml of *water R* for 1 min and filter. To the filtrate add 0.5 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R2*. Allow to stand for 5 min. Any opalescence is not more intense than that in a standard prepared at the same time by adding 0.5 ml of *silver nitrate solution R2* to 25 ml of *water R* containing 0.2 ml of 0.01 M *hydrochloric acid* and 0.5 ml of *dilute nitric acid R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 20 ml of *acetic anhydride R* and add 30 ml of *glacial acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.55 mg of total quinolines, calculated as clioquinol.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

- A. R1 = Cl, R2 = H: 5-chloroquinolin-8-ol,
 B. R1 = R2 = Cl: 5,7-dichloroquinolin-8-ol,
 C. R1 = R2 = I: 5,7-diiodoquinolin-8-ol.

CLOBAZAM

Clobazamum

$C_{16}H_{13}ClN_2O_2$

M_r 300.7

DEFINITION

7-Chloro-1-methyl-5-phenyl-1,5-dihydro-3H-1,5-benzodiazepine-2,4-dione.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of clobazam.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of clobazam impurity A CRS in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of chlordiazepoxide CRS and 5 mg of clonazepam CRS in the mobile phase and dilute to 50 ml with the mobile phase. Dilute 1 ml of the solution to 100 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: acetonitrile R, water R (40:60 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 μ l.

Run time: 5 times the retention time of clobazam.

Retention time: clobazam = about 15 min.

System suitability: reference solution (b):

- resolution: minimum 1.3 between the peaks due to chlordiazepoxide and clonazepam.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- any other impurity: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- total of other impurities: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 50.0 mg in alcohol R and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 250.0 ml with alcohol R. Measure the absorbance (2.2.25) at the maximum at 232 nm.

Calculate the content of $C_{16}H_{13}ClN_2O_2$ taking the specific absorbance to be 1380.

IMPURITIES

- A. R1 = R3 = R4 = H, R2 = Cl: 7-chloro-5-phenyl-1,5-dihydro-3H-1,5-benzodiazepine-2,4-dione,

F. methyl 3-[[4-chloro-2-(phenylamino)phenyl]methylamino]-3-oxopropanoate.

01/2005:1090
corrected**CLOBETASONE BUTYRATE**

Clobetasoni butyras

 $C_{26}H_{32}ClFO_5$ M_r 479.0**DEFINITION**

Clobetasone butyrate contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 21-chloro-9-fluoro-16β-methyl-3,11,20-trioxopregna-1,4-dien-17-yl butanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, slightly soluble in alcohol.

It melts at about 178 °C.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clobetasone butyrate* CRS. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *clobetasone butyrate* CRS in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *clobetasol propionate R* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *methyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution RI* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the test solution is yellow and that of the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 127 to + 133, calculated with reference to the dried substance.

Related substances. Prepare the solutions immediately before use.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 5.0 ml of *ethanol R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *clobetasone butyrate* CRS and 1.5 mg of *clobetasol propionate R* in 5 ml of *ethanol R* and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.20 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
 - as mobile phase at a flow rate of 1 ml/min a mixture of 45 volumes of *ethanol R* and 55 volumes of *water R*,
 - as detector a spectrophotometer set at 241 nm,
- maintaining the temperature of the column at 60 °C. Inject 20 µl of reference solution (a). When using a recorder, adjust the sensitivity of the system so that the height of the two principal peaks are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (*clobetasol propionate*) and the second peak (*clobetasone butyrate*) is at least five.
- Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart

from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 20.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 235 nm.

Calculate the content of $C_{26}H_{32}ClFO_5$, taking the specific absorbance to be 327.

STORAGE

Store protected from light.

IMPURITIES

A. clobetasone,

B. (17R)-4'-chloro-9-fluoro-16β-methyl-5'-propylspiro[androst-1,4-diene-17,2'(3'H)furan]-3,3',11-trione.

01/2005:2054

CLOFAZIMINE

Clofaziminum

$C_{27}H_{22}Cl_2N_4$

M_r 473.4

DEFINITION

N,5-Bis(4-chlorophenyl)-3-[(1-methylethyl)imino]-3,5-dihydrophenazin-2-amine.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: reddish-brown, fine powder.

Solubility: practically insoluble in water, soluble in methylene chloride, very slightly soluble in ethanol (96 per cent).

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *clofazimine CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *clofazimine CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel GF₂₅₄ plate R*.

Mobile phase: *propanol R*, *methylene chloride R* (6:85 V/V).

Application: 5 µl.

First development: over 2/3 of the plate.

Drying: horizontally in air for 5 min.

Second development: over 2/3 of the plate.

Drying: in air for 5 min.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 2 mg in 3 ml of *acetone R* and add 0.1 ml of *hydrochloric acid R*. An intense violet colour is produced. Add 0.5 ml of a 200 g/l solution of *sodium hydroxide R*; the colour changes to orange-red.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *clofazimine for system suitability CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Column:

— **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,

— **stationary phase:** *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 2.25 g of *sodium laurilsulfate R*, 0.85 g of *tetrabutylammonium hydrogen sulphate R* and 0.885 g of *disodium hydrogen phosphate R* in *water R*. Adjust to pH 3.0 with *dilute phosphoric acid R* and dilute to 500 ml with *water R*. Mix 35 volumes of this solution and 65 volumes of *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Run time: 3 times the retention time of clofazimine.

Identification of impurities: use the chromatogram supplied with *clofazimine for system suitability CRS* to identify the peak due to impurity B.

Relative retention with reference to clofazimine (retention time = about 15 min): impurity A = about 0.7; impurity B = about 0.8.

System suitability: reference solution (b):

- **resolution:** baseline separation between the peaks due to impurity B and clofazimine.

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity B:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 5 ml of *methylene chloride R* and add 20 ml of *acetone R* and 5 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 47.34 mg of $C_{27}H_{22}Cl_2N_4$.

IMPURITIES

Specified impurities: A, B.

- A. R1 = Cl, R2 = H: *N*,5-bis(4-chlorophenyl)-3-imino-3,5-dihydrophenazin-2-amine,
- B. R1 = H, R2 = $CH(CH_3)_2$: 5-(4-chlorophenyl)-3-[(1-methylethyl)imino]-*N*-phenyl-3,5-dihydrophenazin-2-amine.

01/2005:0318

CLOFIBRATE

Clofibratum

$C_{12}H_{15}ClO_3$

M_r 242.7

DEFINITION

Clofibrate is ethyl 2-(4-chlorophenoxy)-2-methylpropionate.

CHARACTERS

A clear, almost colourless liquid, very slightly soluble in water, miscible with alcohol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clofibrate CRS*.
- B. Dissolve 0.10 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R* (solution a). Examined between 250 nm and 350 nm (2.2.25), solution (a) shows two absorption maxima, at 280 nm and at 288 nm. The specific absorbances at the maxima are about 44 and 31, respectively. Dilute 10.0 ml of solution (a) to 100.0 ml with *methanol R*. Examined between 220 nm and 250 nm, the solution shows an absorption maximum at 226 nm. The specific absorbance at the maximum is about 460.

TESTS

Refractive index (2.2.6): 1.500 to 1.505.

Relative density (2.2.5): 1.138 to 1.147.

Acidity. To 1.0 g add 10 ml of *ethanol R* and 0.1 ml of *phenol red solution R*. Not more than 1.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Volatile related substances. Examine by gas chromatography (2.2.28).

Test solution. To 10.0 g of the substance to be examined add a mixture of 10 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R*. Shake, separate the lower (organic) layer, wash with 5 ml of *water R* and add the washings to the aqueous layer. Dry the organic layer with *anhydrous sodium sulphate R* and use as the test solution. Reserve the aqueous layer for the test for 4-chlorophenol.

Reference solution (a). Dissolve 0.12 g of the substance to be examined in *chloroform R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *chloroform R*.

Reference solution (b). Dissolve 0.12 g of *methyl 2-(4-chlorophenoxy)-2-methylpropionate CRS* in the substance to be examined and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with the substance to be examined. Dilute 1.0 ml of this solution to 10.0 ml with the substance to be examined.

The chromatographic procedure may be carried out using:

- a column 1.5 m long and 4 mm in internal diameter packed with either: *silanised diatomaceous earth for gas chromatography R* (250 µm to 420 µm) impregnated with 30 per cent *m/m* of *poly(dimethyl)siloxane R*; or *silanised diatomaceous earth for gas chromatography R* (150 µm to 180 µm) impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*,
- *nitrogen for chromatography R* as the carrier gas,
- a flame-ionisation detector.

Maintain the temperature of the column at 185 °C. Inject 2 µl of each solution.

In the chromatogram obtained with the test solution, the sum of the areas of the peaks, except that corresponding to clofibrate, is not greater than ten times the area of the peak corresponding to clofibrate in the chromatogram obtained with reference solution (a) (0.1 per cent). In the chromatogram obtained with reference solution (b), measure from the baseline the height (*A*) of the peak corresponding to methyl 2-(4-chlorophenoxy)-2-methylpropionate and the height (*B*) of the lowest point of the curve separating this peak from the peak corresponding to clofibrate (see Figure 0318-1). The test is not valid unless *A* is equal to at least 30 per cent of the recorder-chart scale and *A* – *B* is greater than 75 per cent of *A*.

Figure 0318-1. – Typical chromatogram for the test for volatile related substances

4-Chlorophenol. Examine by gas chromatography (2.2.28).

Test solution. Shake the aqueous layer reserved in the test for volatile related substances with two quantities, each

of 5 ml, of *chloroform R* and discard the organic layers. Acidify the aqueous layer by the dropwise addition of *hydrochloric acid R*. Shake with three quantities, each of 3 ml, of *chloroform R*. Combine the organic layers and dilute to 10.0 ml with *chloroform R*.

Reference solution. Dissolve 0.25 g of *chlorophenol R* in *chloroform R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *chloroform R*.

The chromatographic procedure may be carried out as described in the test for volatile related substances. Inject 2 µl of each solution.

The area of any peak corresponding to 4-chlorophenol in the chromatogram obtained with the test solution is not greater than the area of the peak corresponding to 4-chlorophenol in the chromatogram obtained with the reference solution (25 ppm).

01/2005:0997

CLOMIFENE CITRATE

Clomifeni citras

$C_{32}H_{36}ClNO_8$

M_r 598.1

DEFINITION

Clomifene citrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of a mixture of the *E*- and *Z*-isomers of 2-[4-(2-chloro-1,2-diphenylethenyl)phenoxy]-*N,N*-diethylethanamine dihydrogen citrate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or pale yellow, crystalline powder, slightly soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clomifene citrate CRS*. Examine the substances as discs prepared using *potassium bromide R*.
- Dissolve about 5 mg in 5 ml of a mixture of 1 volume of *acetic anhydride R* and 5 volumes of *pyridine R* and heat in a water-bath. A deep red colour is produced.

TESTS

Prepare the solutions protected from light in brown-glass vessels. Ensure minimum exposure of the solutions to daylight until they are required for chromatography.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 12.5 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 12.5 mg of *clomifene citrate for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm internal diameter packed with *butylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture prepared as follows: mix 400 ml of *acetonitrile R* with 600 ml of *water R* and add 8.0 ml of *diethylamine R*; adjust the mixture to pH 6.2 by the addition of about 1 ml to 2 ml of *phosphoric acid R* taking care to reduce progressively the volume of each addition as the required pH is approached,
- as detector a spectrophotometer set at 233 nm.

Equilibrate the column with the mobile phase at a flow rate of 1.2 ml/min for about 1 h.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). Continue the chromatography for twice the retention time of the principal peak. Measure the height (*A*) above the base-line of the peak due to impurity A and the height (*B*) above the base-line of the lowest point of the curve separating this peak from the peak due to clomifene. The test is not valid unless *A* is greater than fifteen times *B* and the chromatogram obtained resembles the reference chromatogram. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 10 µl of the test solution and 10 µl of reference solution (b). Continue the chromatography for four times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent); the area of any other peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak with a retention time relative to the clomifene peak of 0.2 or less and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Z-isomer: 30.0 per cent to 50.0 per cent, determined by liquid chromatography (2.2.29).

Test solution. Dissolve 25 mg of the substance to be examined in 25 ml of 0.1 M *hydrochloric acid*, add 5 ml of 1 M *sodium hydroxide* and shake with three quantities, each of 25 ml, of *ethanol-free chloroform R*. Wash the combined extracts with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and dilute to 100 ml with *ethanol-free chloroform R*. To 20 ml of the solution add 0.1 ml of *triethylamine R* and dilute to 100 ml with *hexane R*.

Reference solution. Dissolve 25 mg of *clomifene citrate CRS* in 25 ml of 0.1 M *hydrochloric acid*, add 5 ml of 1 M *sodium hydroxide* and shake with three quantities, each of 25 ml, of *ethanol-free chloroform R*. Wash the combined extracts with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and dilute to 100 ml with *ethanol-free chloroform R*. To 20 ml of the solution add 0.1 ml of *triethylamine R* and dilute to 100 ml with *hexane R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.3 m long and 4 mm in internal diameter packed with *silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 1 volume of *triethylamine R*, 200 volumes of *ethanol-free chloroform R* and 800 volumes of *hexane R*,
- as detector a spectrophotometer set at 302 nm.

Equilibrate the column with the mobile phase for about 2 h. Inject 50 µl of the reference solution. The chromatogram obtained shows a peak due to the *E*-isomer just before a peak due to the *Z*-isomer. The test is not valid unless the resolution between the peaks corresponding to the *E*- and *Z*-isomers is at least 1.0. If necessary, adjust the relative proportions of ethanol-free chloroform and hexane in the mobile phase. Measure the area of the peak due to the *Z*-isomer in the chromatograms obtained with the test solution and the reference solution. Calculate the content of the *Z*-isomer as a percentage of the total clomifene citrate present using the declared content of *clomifene citrate CRS*.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.000 g by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 59.81 mg of C₃₂H₃₆ClNO₈.

STORAGE

Store protected from light.

IMPURITIES

A. 2-[4-(1,2-diphenylethenyl)phenoxy]-*N,N*-diethylethanamine,

B. [4-[2-(diethylamino)ethoxy]phenyl]phenylmethanone,

C. (2*RS*)-2-[4-[2-(diethylamino)ethoxy]phenyl]-1,2-diphenylethanone,

D. 2,2-bis[4-[2-(diethylamino)ethoxy]phenyl]-1,2-diphenylethanone,

E. 2-[4-[1,2-bis(4-chlorophenyl)ethenyl]phenoxy]-*N,N*-diethylethanamine,

F. 2-[4-[2-chloro-2-(4-chlorophenyl)-1-phenylethenyl]phenoxy]-*N,N*-diethylethanamine,

GH. 2-[2-chloro-4-(2-chloro-1,2-diphenylethenyl)phenoxy]-*N,N*-diethylethanamine (G. higher-melting point isomer; H. lower-melting point isomer).

01/2005:0889

CLOMIPRAMINE HYDROCHLORIDE

Clomipramini hydrochloridum

 $C_{19}H_{24}Cl_2N_2$
 M_r 351.3

DEFINITION

3-(3-Chloro-10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N,N*-dimethylpropan-1-amine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water and in methylene chloride, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 191 °C to 195 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of *potassium bromide R*. The transmittance at about 2000 cm⁻¹ (5 µm) is at least 65 per cent without compensation.

Comparison: clomipramine hydrochloride CRS.

C. Thin-layer chromatography (2.2.27). Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *clomipramine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: concentrated ammonia R, acetone R, ethyl acetate R (5:25:75 V/V/V).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 5 g/l solution of *potassium dichromate R* in a 20 per cent V/V solution of *sulphuric acid R*. Examine immediately.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 5 mg in 2 ml of *nitric acid R*. An intense blue colour develops.

E. Dissolve about 50 mg in 5 ml of *water R* and add 1 ml of *dilute ammonia R1*. Mix, allow to stand for 5 min and filter. Acidify the filtrate with *dilute nitric acid R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method D).

pH (2.2.3): 3.5 to 5.0 for solution S.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of mobile phases.

Reference solution (a). Dissolve 22.6 mg of *imipramine hydrochloride CRS*, 4.0 mg of *clomipramine impurity C CRS*, 4.0 mg of *clomipramine impurity D CRS* and 2.0 mg of *clomipramine impurity F CRS* in a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A and dilute to 100.0 ml with the same mixture of mobile phases. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A.

Reference solution (c). Dissolve 10.0 mg of *clomipramine hydrochloride CRS* and 3.0 mg of *clomipramine impurity C CRS* in a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A and dilute to 20.0 ml with the same mixture of mobile phases. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 25 volumes of mobile phase B and 75 volumes of mobile phase A.

Column:

— size: *l* = 0.25 m, Ø = 4.6 mm,

- *stationary phase*: cyanopropylsilyl silica gel for chromatography *R* (5 µm),
- *temperature*: 30 °C.

Mobile phase:

- *mobile phase A*: dissolve 1.2 g of *sodium dihydrogen phosphate R* in *water R*, add 1.1 ml of *nonylamine R*, adjust to pH 3.0 with *phosphoric acid R* and dilute to 1000 ml with *water R*,
- *mobile phase B*: *acetonitrile R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	75	25
10 - 20	75 → 65	25 → 35
20 - 32	65	35
32 - 34	65 → 75	35 → 25
34 - 44	75	25

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Relative retentions with reference to clomipramine (retention time = about 8 min): impurity A = about 0.5; impurity B = about 0.7; impurity C = about 0.9; impurity D = about 1.7; impurity E = about 2.5; impurity F = about 3.4; impurity G = about 4.3.

System suitability: reference solution (c):

- *resolution*: minimum 3.0 between the peaks due to clomipramine and to impurity C.

Limits:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *impurity C, D*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *any other impurity*: not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total of other impurities*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

2.0 g complies with limit test C. Prepare the standard using 4 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 *M hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 *M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 35.13 mg of C₁₉H₂₄Cl₂N₂.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. *N*-[3-(3-chloro-10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)propyl]-*N,N',N'*-trimethylpropane-1,3-diamine,

B. imipramine,

C. 3-(3-chloro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N,N*-dimethylpropan-1-amine,

D. R1 = R3 = Cl, R2 = CH₂-CH₂-CH₂-N(CH₃)₂: 3-(3,7-dichloro-10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N,N*-dimethylpropan-1-amine,

E. R1 = R2 = R3 = H: 10,11-dihydro-5*H*-dibenzo[*b,f*]azepine (iminodibenzyl),

F. R1 = Cl, R2 = R3 = H: 3-chloro-10,11-dihydro-5*H*-dibenzo[*b,f*]azepine,

G. R1 = Cl, R2 = CH₂-CH=CH₂, R3 = H: 3-chloro-5-(prop-2-enyl)-10,11-dihydro-5*H*-dibenzo[*b,f*]azepine.

01/2005:0890 *Detection*: spectrophotometer at 254 nm.*Injection*: 10 µl.*Run time*: 3 times the retention time of clonazepam.*Relative retention* with reference to clonazepam (retention time = about 7 min): impurity B = about 2.1; impurity A = about 2.4.*System suitability*: reference solution (b):

- *resolution*: minimum 1.8 between the peaks due to flunitrazepam and to clonazepam.

Limits:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent)
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.275 g in 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).1 ml of 0.1 M *perchloric acid* is equivalent to 31.57 mg of C₁₅H₁₀ClN₃O₃.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B.

A. (2-amino-5-nitrophenyl)(2-chlorophenyl)methanone,

B. 3-amino-4-(2-chlorophenyl)-6-nitroquinolin-2(1H)-one.

CLONAZEPAM

Clonazepamum

C₁₅H₁₀ClN₃O₃*M_r* 315.7

DEFINITION

5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: slightly yellowish, crystalline powder.*Solubility*: practically insoluble in water, slightly soluble in alcohol and in methanol.

mp: about 239 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of clonazepam*.

TESTS

Related substances. Liquid chromatography (2.2.29). Carry out the test protected from light and prepare the solutions immediately before use.*Solvent mixture*: tetrahydrofuran *R*, methanol *R*, water *R* (10:42:48 V/V/V).*Test solution*. Dissolve 0.100 g of the substance to be examined in methanol *R* and dilute to 20.0 ml with the same solvent. Dilute 1.0 ml to 10.0 ml with the solvent mixture.*Reference solution (a)*. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.*Reference solution (b)*. Dissolve 5 mg of the substance to be examined and 5 mg of flunitrazepam *R* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.*Reference solution (c)*. Dissolve 1.0 mg of clonazepam impurity B CRS in the solvent mixture and dilute to 20.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: end-capped octylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: mix 10 volumes of tetrahydrofuran *R*, 42 volumes of methanol *R* and 48 volumes of a 6.6 g/l solution of ammonium phosphate *R* previously adjusted to pH 8.0 with a 40 g/l solution of sodium hydroxide *R* or dilute phosphoric acid *R*.*Flow rate*: 1.0 ml/min.

01/2005:0477

CLONIDINE HYDROCHLORIDE

Clonidini hydrochloridum

 $C_9H_{10}Cl_3N_3$ M_r 266.6**DEFINITION**

Clonidine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2,6-dichloro-*N*-(imidazolidin-2-ylidene)aniline, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water and in ethanol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 30.0 mg in 0.01 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Examined between 245 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 272 nm and at 279 nm, and a point of inflexion at 265 nm. The specific absorbances at the maxima are about 18 and about 16, respectively.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with clonidine hydrochloride CRS.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in carbon dioxide-free water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_7 (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 4.0 to 5.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel *G R* as the coating substance.

Test solution (a). Dissolve 0.1 g of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with methanol *R*.

Reference solution (a). Dissolve 10 mg of clonidine hydrochloride CRS in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 10 ml with methanol *R*. Dilute 5 ml of this solution to 100 ml with methanol *R*.

Apply to the plate 10 µl of each solution. Shake a mixture of 10 volumes of glacial acetic acid *R*, 40 volumes of butanol *R* and 50 volumes of water *R*. Allow to separate. Filter the upper layer and use the filtrate as the mobile phase. Develop

over a path of 15 cm. Allow the plate to dry in air and spray with potassium iodobismuthate solution *R2*. Allow the plate to dry in air for 1 h, spray again with potassium iodobismuthate solution *R2* and then immediately spray with a 50 g/l solution of sodium nitrite *R*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 70 ml of alcohol *R*. Titrate with 0.1 *M* ethanolic sodium hydroxide determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* sodium hydroxide is equivalent to 26.66 mg of $C_9H_{10}Cl_3N_3$.

01/2005:1716

CLOSADEL SODIUM DIHYDRATE FOR VETERINARY USEClosantelum natricum dihydricum
ad usum veterinarium $C_{22}H_{13}Cl_2I_2N_2NaO_2 \cdot 2H_2O$ M_r 721**DEFINITION**

N-[5-Chloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]-2-methylphenyl]-2-hydroxy-3,5-diiodobenzamide sodium salt dihydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow powder, slightly hygroscopic.

Solubility: very slightly soluble in water, freely soluble in ethanol (96 per cent), soluble in methanol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs without recrystallisation.

Comparison: closantel sodium dihydrate CRS.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY_4 (2.2.2, Method II).

Dissolve 0.50 g in ethanol (96 per cent) *R* and dilute to 50 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *closantel for system suitability CRS* (containing impurities A to J) in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octadecylsilyl silica gel for chromatography R (3 μ m),
- temperature: 35 °C.

Mobile phase:

- mobile phase A: to 100 ml of a 7.7 g/l solution of ammonium acetate R previously adjusted to pH 4.3 with acetic acid R, add 50 ml of acetonitrile R and 850 ml of water R,
- mobile phase B: to 100 ml of a 7.7 g/l solution of ammonium acetate R previously adjusted to pH 4.3 with acetic acid R, add 50 ml of water R and 850 ml of acetonitrile R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	50	50
2 - 22	50 → 20	50 → 80
22 - 27	20	80
27 - 28	20 → 50	80 → 50
28 - 32	50	50

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 μ l.

Relative retention with reference to closantel (retention time = about 16 min): impurity A = about 0.07; impurity B = about 0.48; impurity C = about 0.62; impurity D = about 0.65; impurity E = about 0.82; impurity F = about 0.89; impurity G = about 0.93; impurity H = about 1.13; impurity I = about 1.16; impurity J = about 1.55.

System suitability: reference solution (a):

- resolution: baseline separation between the peaks due to impurity G and closantel,
- the chromatogram obtained is similar to the chromatogram supplied with *closantel for system suitability CRS*.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.5; impurity B = 1.3;
- impurity G: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- impurities F, H, I: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- impurities A, B, C, D, E, J: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- total: not more than 7.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): 4.8 per cent to 5.8 per cent, determined on 0.250 g.

Use a mixture of 1 volume of *dimethylformamide R* and 4 volumes of *methanol R* as the solvent.

ASSAY

Dissolve 0.500 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 68.5 mg of $C_{22}H_{13}Cl_2I_2N_2NaO_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J.

A. 2-hydroxy-3,5-diiodobenzoic acid,

B. (2RS)-(4-amino-2-chloro-5-methylphenyl)(4-chlorophenyl)ethanenitrile,

- C. R1 = H, R2 = CO₂H, R3 = I: (2*RS*)-[2-chloro-4-[(2-hydroxy-3,5-diiodobenzoyl)amino]-5-methylphenyl](4-chlorophenyl)acetic acid,
- D. R1 = H, R2 = CONH₂, R3 = I: *N*-[4-[(1*RS*)-2-amino-1-(4-chlorophenyl)-2-oxoethyl]-5-chloro-2-methylphenyl]-2-hydroxy-3,5-diiodobenzamide,
- E. R1 = H, R2 = CN, R3 = Cl: 3-chloro-*N*-[5-chloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]-2-methylphenyl]-2-hydroxy-5-iodobenzamide,
- F. R1 + R2 = O, R3 = I: *N*-[5-chloro-4-(4-chlorobenzoyl)-2-methylphenyl]-2-hydroxy-3,5-diiodobenzamide,
- G. R1 = H, R2 = C(=NH)OCH₃, R3 = I: methyl (2*RS*)-2-[2-chloro-4-[(2-hydroxy-3,5-diiodobenzoyl)amino]-5-methylphenyl]-2-(4-chlorophenyl)acetimidate,
- H. R1 = H, R2 = CO-OCH₃, R3 = I: methyl (2*RS*)-[2-chloro-4-[(2-hydroxy-3,5-diiodobenzoyl)amino]-5-methylphenyl](4-chlorophenyl)acetate,
- I. R1 = R3 = H, R2 = CN: *N*-[5-chloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]-2-methylphenyl]-2-hydroxy-5-iodobenzamide,

- J. *N*-[5-chloro-4-[[4-[[2-chloro-4-[(2-hydroxy-3,5-diiodobenzoyl)amino]-5-methylphenyl]cyanomethyl]phenyl](4-chlorophenyl)cyanomethyl]-2-methylphenyl]-2-hydroxy-3,5-diiodobenzamide.

01/2005:0757

CLOTRIMAZOLE

Clotrimazolum

C₂₂H₁₇ClN₂M_r 344.8

DEFINITION

Clotrimazole contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of 1-[(2-chlorophenyl)diphenylmethyl]-1*H*-imidazole, calculated with reference to the dried substance.

CHARACTERS

A white or pale yellow, crystalline powder, practically insoluble in water, soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 141 °C to 145 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clotrimazole CRS*.
- C. Examine before spraying in ultraviolet light at 254 nm, the chromatograms obtained in the test for (2-chlorophenyl)diphenylmethanol. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 10 mg in 3 ml of *sulphuric acid R*. The solution is pale yellow. Add 10 mg of *mercuric oxide R* and 20 mg of *sodium nitrite R*. Allow to stand with occasional shaking. An orange colour develops, becoming orange-brown.

TESTS

Appearance of solution. Dissolve 1.25 g in *alcohol R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

(2-Chlorophenyl)diphenylmethanol. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *alcohol R*.

Reference solution (a). Dissolve 50 mg of *clotrimazole CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of (2-chlorophenyl)diphenylmethanol *CRS* in *alcohol R* and dilute to 5 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *alcohol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.5 volumes of *concentrated ammonia R1*, 10 volumes of *propanol R* and 90 volumes of *toluene R*. Allow the plate to dry in air. Spray with a 10 per cent *V/V* solution of *sulphuric acid R* in *alcohol R* and heat at 100 °C to 105 °C for 30 min. Any spot corresponding to (2-chlorophenyl)diphenylmethanol in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Imidazole. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *imidazole R* in *alcohol R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *alcohol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.5 volumes of *concentrated ammonia R1*, 10 volumes of *propanol R* and 90 volumes of *toluene R*. Allow the plate to dry in air. At the bottom of a chromatography tank, place an evaporating dish containing a mixture of 1 volume of *hydrochloric acid R1*, 1 volume of *water R* and 2 volumes of a 15 g/l solution of *potassium permanganate R*, close the tank and allow to stand for 15 min. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 5 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Spray with *potassium iodide and starch solution R*. Any spot corresponding to imidazole in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* using 0.3 ml of *naphtholbenzein solution R* as indicator until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 34.48 mg of $C_{22}H_{17}ClN_2$.

STORAGE

Store protected from light.

upper part of the hypanthium. The head is globular and dome-shaped, composed of four imbricated petals that enclose numerous incurved stamens and a short, erect style with a nectary disc at the base. The hypanthium exudes essential oil when indented with the finger-nail.

B. Reduce to a powder (355). The powder is dark brown and has the odour and taste of the unground drug. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the hypanthium showing the epidermis and underlying parenchyma containing large oil glands; short fibres occurring singly or in small groups, with thickened, lignified walls and few pits; abundant fragments of parenchyma containing cluster crystals of calcium oxalate; numerous triangular pollen grains about 15 µm in diameter with three pores in the angles. Starch granules are absent.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Shake 0.1 g of the powdered drug (500) with 2 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2 ml of *toluene R*.

Reference solution. Dissolve 20 µl of *eugenol R* in 2 ml of *toluene R*.

Apply to the plate as bands 20 mm by 3 mm, 10 µl of the reference solution and 20 µl of the test solution. Develop in an unsaturated tank over a path of 10 cm using *toluene R*. Allow the plate to stand for 5 min and develop again in the same manner. Allow the plate to dry in air, examine in ultraviolet light at 254 nm and mark the quenching zones. In the chromatogram obtained with the test solution there is in the median part a quenching zone (eugenol) similar in position to the quenching zone in the chromatogram obtained with the reference solution and there may be a weak quenching zone (acetyleugenol) just below the zone corresponding to eugenol. Spray the plate with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and examine in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The zones corresponding to eugenol in the chromatograms obtained with the test and reference solutions have a strong brownish-violet colour and the zone corresponding to acetyleugenol in the chromatogram obtained with the test solution is faint violet-blue. In the chromatogram obtained with the test solution there are other coloured zones, particularly a faint red zone in the lower part and a reddish-violet zone (caryophyllene) in the upper part.

01/2005:0376

CLOVE

Caryophylli flos

DEFINITION

Clove consists of the whole flower buds of *Syzygium aromaticum* (L.) Merril et L. M. Perry (*Eugenia caryophyllus* (C. Spreng.) Bull. et Harr.) dried until they become reddish-brown. It contains not less than 150 ml/kg of essential oil.

CHARACTERS

Clove has a characteristic, aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The flower bud is reddish-brown and consists of a quadrangular stalked portion, the hypanthium, 10 mm to 12 mm long and 2 mm to 3 mm in diameter, surmounted by four divergent lobes of sepals which surround a globular head 4 mm to 6 mm in diameter. A bilocular ovary containing numerous ovules is situated in the

TESTS

Foreign matter (2.8.2). Not more than 6 per cent of peduncles, petioles and fruits, not more than 2 per cent of deteriorated cloves and not more than 0.5 per cent of other foreign matter.

Total ash (2.4.16). Not more than 7.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 250 ml flask, 100 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Grind 5.0 g of the drug with 5.0 g of *diatomaceous earth R* to form a fine, homogeneous powder and proceed immediately with the determination using 4.0 g of the mixture. Distil at a rate of 2.5 ml/min to 3.5 ml/min for 2 h.

STORAGE

Store protected from light.

01/2005:1091 **Chromatographic profile.** Examine by gas chromatography (2.2.28).

CLOVE OIL

Caryophylli floris aetheroleum

DEFINITION

Clove oil is obtained by steam distillation from the dried flower buds of *Syzygium aromaticum* (L.) Merrill et L. M. Perry (*Eugenia caryophyllus* C. Spreng. Bull. et Harr.).

CHARACTERS

A clear, yellow liquid which becomes brown when exposed to air, miscible with methylene chloride, toluene and fatty oils.

IDENTIFICATION

First identification: B.

Second identification: A.

- A. Examine by thin-layer chromatography (2.2.27) using a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Test solution. Dissolve 20 µl of the substance to be examined in 2.0 ml of *toluene R*.

Reference solution. Dissolve 15 µl of *eugenol R* and 15 µl of *acetyleneugenol R* in 2.0 ml of *toluene R*.

Apply separately to the plate, as bands, 20 µl of the test solution and 15 µl of the reference solution. Develop in an unsaturated tank over a path of 10 cm using *toluene R*. Allow the plate to stand for 5 min and develop again in the same manner. Allow the plate to dry in air, examine in ultraviolet light at 254 nm and mark the quenching zones. The chromatogram obtained with the test solution shows in the medium part a quenching zone (eugenol) which corresponds in position to the quenching zone in the chromatogram obtained with the reference solution; there is a weak quenching zone (acetyleneugenol) just below the quenching zone of eugenol which corresponds in position to the zone of acetyleneugenol in the chromatogram obtained with the reference solution. Spray the plate with *anisaldehyde solution R* and examine in daylight while heating at 100 °C to 105 °C for 5 to 10 min. The zones corresponding to eugenol in the chromatogram obtained with the test and reference solutions have a strong brownish-violet colour and the zone corresponding to acetyleneugenol in the chromatogram obtained with the test solution is faint violet-blue. In the chromatogram obtained with the test solution there are other coloured zones particularly a faint red zone in the lower part and a reddish-violet zone (β-caryophyllene) in the upper part.

- B. Examine the chromatograms obtained in the test for chromatographic profile. The chromatogram obtained with the test solution shows three main peaks similar in retention time to the three peaks obtained with the reference solution.

TESTS

Relative density (2.2.5): 1.030 to 1.063.

Refractive index (2.2.6): 1.528 to 1.537.

Angle of optical rotation (2.2.7): 0° to -2°.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified oils.

Solubility in alcohol (2.8.10). 1.0 ml is soluble in 2.0 ml or more of *alcohol* (70 per cent V/V) *R*.

Test solution. Dissolve 0.2 g of the substance to be examined in 10 g of *hexane R*.

Reference solution. Dissolve 7 mg of β-caryophyllene *R*, 80 mg of *eugenol R* and 4 mg of *acetyleneugenol R* in 10 g of *hexane R*.

The chromatographic procedure may be carried out using:

- a fused silica capillary column 60 m long and about 0.25 mm in internal diameter, coated with *macrogol* 20 000 *R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml per min,
- a flame-ionisation detector,
- a split ratio of 1/100,

maintaining the temperature of the column at 60 °C for 8 min, then raising the temperature at a rate of 3 °C per min to 180 °C and maintaining at 180 °C for 5 min and maintaining the temperature of the injection port and that of the detector at 270 °C.

Inject about 1.0 µl of the reference solution. Identify the eluted components following the order indicated in the composition of the reference solution. Record the retention times of these substances.

The test is not valid unless: the number of theoretical plates is at least 30 000, calculated from the β-caryophyllene peak at 110 °C and the resolution between the peak corresponding to eugenol and that corresponding to acetyleneugenol is at least 1.5.

Inject about 1.0 µl of the substance to be examined. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution. Disregard the peak due to the solvent.

Determine the percentage content of each of the three components by the normalisation procedure. The contents are within the following ranges:

- β-caryophyllene: 5.0 per cent to 14.0 per cent,
- *eugenol*: 75.0 per cent to 88.0 per cent,
- *acetyleneugenol*: 4.0 per cent to 15.0 per cent.

STORAGE

Store in a well-filled, airtight container, protected from light and heat.

01/2005:0661

CLOXACILLIN SODIUM

Cloxacillinum natricum

C₁₉H₁₇ClN₃NaO₅S·H₂O

*M*_r 475.9

DEFINITION

Cloxacillin sodium contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of sodium (2*S*,5*R*,6*R*)-6-[[[3-(2-chlorophenyl)-5-oxo-2,3-dihydro-4H-1,2,4-oxadiazol-4-yl]acetyl]amino]-3,3-dimethyl-2-thioxo-1,2,3,4-tetrahydro-1H-2H-pyridine-2-carboxylate sodium salt.

methylisoxazol-4-yl]carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water and in methanol, soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cloxacillin sodium CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.
Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.
Reference solution (a). Dissolve 25 mg of *cloxacillin sodium CRS* in 5 ml of *water R*.
Reference solution (b). Dissolve 25 mg of each of *cloxacillin sodium CRS*, *dicloxacillin sodium CRS* and *flucloxacillin sodium CRS* in 5 ml of *water R*.
Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R*, adjusted to pH 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.
- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the colour of the solution is slightly greenish-yellow. Place the test-tube in a water-bath for 1 min; the solution becomes yellow.
- D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 430 nm is not greater than 0.04.

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 160 to + 169, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject test solution (a) and continue the chromatography for five times the retention time of the principal peak. Inject reference solution (b). In the chromatogram obtained with test solution (a): the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of

the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.8 per cent *m/m*.

Water (2.5.12): 3.0 per cent to 4.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.40 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *cloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of test solution (b) to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *flucloxacillin sodium CRS* and 5 mg of *cloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 2.7 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R*,
- as detector a spectrophotometer set at 225 nm,
- a 20 µl loop injector.

Inject reference solution (c). Adjust the sensitivity of the system so that the heights of the principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for cloxacillin is at most 1.0 per cent. Inject alternately test solution (b) and reference solution (a).

STORAGE

Store in an airtight container, at a temperature not exceeding 25 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R = CO₂H: (4*S*)-2-[carboxy[[[3-(2-chlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of cloxacillin),
- B. R = H: (2*RS*,4*S*)-2-[[[3-(2-chlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of cloxacillin),

- C. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- D. 3-(2-chlorophenyl)-5-methylisoxazole-4-carboxylic acid,

- E. (2*S*,5*R*,6*R*)-6-[[[(2*S*,5*R*,6*R*)-6-[[[3-(2-chlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-APA cloxacillin amide).

01/2005:1191

CLOZAPINE

Clozapinum

C₁₈H₁₉ClN₄M_r 326.8

DEFINITION

Clozapine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 8-chloro-11-(4-methylpiperazin-1-yl)-5*H*-dibenzo[*b,e*][1,4]diazepine, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, soluble in alcohol. It dissolves in dilute acetic acid.

IDENTIFICATION

- A. Melting point (2.2.14): 182 °C to 186 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *clozapine CRS*. Examine the substances prepared as discs.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Before use, develop the plate with a mixture of 25 volumes of *methanol R* and 75 volumes of *methylene chloride R*. Allow the plate to dry in air for 15 min.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methylene chloride R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methylene chloride R*.

Reference solution (a). Dissolve 20 mg of *clozapine CRS* in *methylene chloride R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1.5 ml of test solution (b) to 50 ml with *methylene chloride R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 50 ml with *methylene chloride R*.

Reference solution (d). Dilute 5 ml of reference solution (c) to 10 ml with *methylene chloride R*.

Reference solution (e). Dissolve 10 mg of *clozapine CRS* and 10 mg of *oxazepam CRS* in *methylene chloride R* and dilute to 5 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 25 volumes of *methanol R* and 75 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent); at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent); and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows two clearly separated spots and the chromatogram obtained with reference solution (d) shows a clearly visible spot.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 16.34 mg of $C_{18}H_{19}ClN_4$.

IMPURITIES

A. 8-chloro-5,10-dihydro-11H-dibenzo[*b,e*][1,4]diazepin-11-one,

B. 11,11'-(piperazin-1,4-diyl)bis(8-chloro-5H-dibenzo[*b,e*][1,4]diazepine),

C. 8-chloro-11-(piperazin-1-yl)-5H-dibenzo[*b,e*][1,4]diazepine.

01/2005:0073

COCAINE HYDROCHLORIDE

Cocaini hydrochloridum

$C_{17}H_{22}ClNO_4$

M_r 339.8

DEFINITION

Methyl (1*R*,2*R*,3*S*,5*S*)-3-(benzoyloxy)-8-methyl-8-azabicyclo[3.2.1]octane-2-carboxylate hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: very soluble in water, freely soluble in alcohol, slightly soluble in methylene chloride.

mp: about 197 °C, with decomposition.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

- Dissolve 20.0 mg in 0.01 M hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of the solution to 50.0 ml with 0.01 M hydrochloric acid. Examined between 220 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 233 nm and 273 nm. The specific absorbance at 233 nm is 378 to 402.
- Infrared absorption spectrophotometry (2.2.24).
Comparison: Ph. Eur. reference spectrum of cocaine hydrochloride.
- Dissolve 0.1 g in 5 ml of water *R* and add 1 ml of dilute ammonia *R*2. A white precipitate is formed. Initiate crystallisation by scratching the wall of the tube with a glass rod. The crystals, washed with water *R* and dried *in vacuo*, melt (2.2.14) at 96 °C to 99 °C.
- It gives reaction (a) of chlorides (2.3.1).
- It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 0.05 ml of methyl red solution *R*. Not more than 0.2 ml of 0.02 M sodium hydroxide is required to change the colour of the indicator.

Specific optical rotation (2.2.7): –70 to –73 (dried substance).

Dissolve 0.50 g in water *R* and dilute to 20.0 ml with the same solvent.

Readily carbonisable substances. To 0.2 g add 2 ml of sulphuric acid *R*. After 15 min, the solution is not more intensely coloured than reference solution BY₅ (2.2.2, *Method I*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of the substance to be examined in 0.01 M sodium hydroxide and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with 0.01 M sodium hydroxide. Allow the solution to stand for 15 min.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m) with a specific surface area of 335 m²/g, a pore size of 10 nm and a carbon loading of 19.1 per cent,
- temperature: 35 °C.

Mobile phase: triethylamine *R*, tetrahydrofuran *R*, acetonitrile *R*, water *R* (0.5:100:430:479.5 V/V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 216 nm.

Injection: 20 μ l.

Relative retention with reference to cocaine (retention time = about 7.4 min): degradation product = about 0.7.

System suitability: reference solution (b):

01/2005:1410

- *resolution*: minimum of 5 between the peaks due to cocaine and to the degradation product.

Limits:

- *any impurity eluting after the principal peak*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on the residue from the test for loss on drying.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 33.98 mg of C₁₇H₂₂ClNO₄.

STORAGE

Protected from light.

IMPURITIES

- A. methyl (1R,2R,3S,5S)-8-methyl-3-[(E)-3-phenylpropenoyl]oxy]-8-azabicyclo[3.2.1]octane-2-carboxylate (cinnamoylcocaine),

- B. bis[(1R,2R,3S,5S)-2-(methoxycarbonyl)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl] (1R,2C,3t,4t)-2,4-diphenylcyclobutane-1,3-dicarboxylate (α-truxilline),

- C. bis[(1R,2R,3S,5S)-2-(methoxycarbonyl)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl] (1R,2C,3t,4t)-3,4-diphenylcyclobutane-1,2-dicarboxylate (β-truxilline).

COCONUT OIL, REFINED

Cocois oleum raffinatum

DEFINITION

Refined coconut oil is the fatty oil obtained from the dried, solid part of the endosperm of *Cocos nucifera* L., then refined.

CHARACTERS

A white or almost white, unctuous mass, practically insoluble in water, freely soluble in methylene chloride and in light petroleum (bp: 65 °C to 70 °C), very slightly soluble in alcohol.

The refractive index is about 1.449, determined at 40 °C.

IDENTIFICATION

- A. It complies with the test for melting point (see Tests).
B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Melting point (2.2.14): 23 °C to 26 °C.

Acid value (2.5.1). Not more than 0.5, determined on 20.0 g.

Peroxide value (2.5.5). Not more than 5.0.

Unsaponifiable matter (2.5.7). Not more than 1.0 per cent, determined on 5.0 g.

Alkaline impurities in fatty oils (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (2.4.22, Method B). Coconut oil is melted under gentle heating to a homogeneous liquid prior to sampling.

Reference solution. Dissolve 15.0 mg of *tricaproin* CRS, 80.0 mg of *tristearin* CRS, 0.150 g of *tricaprin* CRS, 0.200 g of *tricaprylin* CRS, 0.450 g of *trimyristin* CRS and 1.25 g of *trilaurin* CRS in a mixture of 2 volumes of methylene chloride R and 8 volumes of heptane R and dilute to 50 ml with the same mixture of solvents heating at 45 °C to 50 °C. Transfer 2 ml to a 10 ml centrifuge tube with a screw cap and evaporate the solvent in a current of nitrogen R. Dissolve with 1 ml of heptane R and 1 ml of dimethyl carbonate R and mix vigorously under gentle heating (50 °C to 60 °C). Add, while still warm, 1 ml of a 12 g/l solution of sodium R in anhydrous methanol R, prepared with the necessary precautions and mix vigorously for about 5 min. Add 3 ml of distilled water R and mix vigorously for about 30 s. Centrifuge for 15 min at 1500 g. Inject 1 µl of the organic phase.

Calculate the percentage content of each fatty acid using the following expression:

$$\frac{A_{x,s,c}}{\sum A_{x,s,c}} \times 100 \text{ per cent } m/m$$

$A_{x,s,c}$ is the corrected peak area of each fatty acid in the test solution:

$$A_{x,s,c} = A_{x,s} \times R_c$$

R_c is the relative correction factor:

$$R_c = \frac{m_{x,r} \times A_{1,r}}{A_{x,r} \times m_{1,r}}$$

for the peaks corresponding to caproic, caprylic, capric, lauric and myristic acid methyl esters.

- $m_{x,r}$ = mass of tricaproin, tricaprylin, tricaprin, trilaurin or trimyristin in the reference solution, in milligrams,
- $m_{1,r}$ = mass of tristearin in the reference solution, in milligrams,
- $A_{x,r}$ = area of the peaks corresponding to caproic, caprylic, capric, lauric and myristic acid methyl esters in the reference solution,
- $A_{1,r}$ = area of the peak corresponding to stearic acid methyl ester in the reference solution,
- $A_{x,s}$ = area of peaks corresponding to any specified or unspecified fatty acid methyl esters,
- R_c = 1 for peaks corresponding to each of the remaining specified fatty acid methyl esters or any unspecified fatty acid methyl ester.

The fatty acid fraction of the oil has the following composition:

- *caproic acid* (R_{Rt} 0.11): not more than 1.5 per cent,
- *caprylic acid* (R_{Rt} 0.23): 5.0 per cent to 11.0 per cent,
- *capric acid* (R_{Rt} 0.56): 4.0 per cent to 9.0 per cent,
- *lauric acid* (R_{Rt} 0.75): 40.0 per cent to 50.0 per cent,
- *myristic acid* (R_{Rt} 0.85): 15.0 per cent to 20.0 per cent,
- *palmitic acid* (R_{Rt} 0.93): 7.0 per cent to 12.0 per cent,
- *stearic acid* (R_{Rt} 1.00): 1.5 per cent to 5.0 per cent,
- *oleic acid and isomers* (R_{Rt} 1.01): 4.0 per cent to 10.0 per cent,
- *linoleic acid* (R_{Rt} 1.03): 1.0 per cent to 3.0 per cent,
- *linolenic acid* (R_{Rt} 1.06): not more than 0.2 per cent,
- *arachidic acid* (R_{Rt} 1.10): not more than 0.2 per cent,
- *eicosenoic acid* (R_{Rt} 1.11): not more than 0.2 per cent.

STORAGE

Store in a well-filled container, protected from light.

C. It complies with the test for composition of fatty acids and fatty alcohols (see Tests).

TESTS

Appearance. The substance to be examined is not more intensely coloured than reference solution Y₅ (2.2.2, *Method I*).

Acid value (2.5.1). Not more than 0.5, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*). Not more than 5.0.

Iodine value (2.5.4). Not more than 1.0.

Saponification value (2.5.6): 160 to 173.

Composition of fatty acids and fatty alcohols (2.4.22, *Method C*). Use the chromatogram obtained with the following reference solution for identification of the peaks corresponding to the fatty alcohols.

Reference solution. Dissolve the following amounts of the substances listed in Table 1411.-1 in 10 ml of *heptane R*.

Table 1411.-1

Substance	Amount (mg)
<i>Methyl caproate R</i>	10
<i>Methyl caprylate R</i>	90
<i>Methyl caprate R</i>	50
<i>Methyl laurate R</i>	20
<i>Methyl myristate R</i>	10
<i>Methyl palmitate R</i>	10
<i>Methyl stearate R</i>	10
<i>Capric alcohol R</i>	10
<i>Lauryl alcohol R</i>	100
<i>Myristyl alcohol R</i>	40
<i>Cetyl alcohol CRS</i>	30
<i>Stearyl alcohol CRS</i>	20

Consider the sum of the areas of the peaks due to the fatty acids listed below to be equal to 100 and the sum of the areas of the peaks due to the fatty alcohols listed below to be equal to 100.

The fatty-acid fraction of the substance has the following composition:

- *caproic acid*: not more than 2.0 per cent,
- *caprylic acid*: 50.0 per cent to 80.0 per cent,
- *capric acid*: 20.0 per cent to 50.0 per cent,
- *lauric acid*: not more than 3.0 per cent,
- *myristic acid*: not more than 1.0 per cent.

The fatty-alcohol fraction of the substance has the following composition:

- *capric alcohol*: not more than 3.0 per cent,
- *lauryl alcohol*: 48.0 per cent to 59.0 per cent,
- *myristyl alcohol*: 18.0 per cent to 25.0 per cent,
- *cetyl alcohol*: 6.0 per cent to 12.0 per cent,
- *stearyl alcohol*: 9.0 per cent to 16.0 per cent.

Water (2.5.12). Not more than 0.1 per cent, determined on 5.00 g by the semi-micro determination of water.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 1.0 g.

01/2005:1411

COCOYL CAPRYLOCAPRATE

Cocoylis caprylocapras

DEFINITION

Cocoyl caprylocaprate is a mixture of esters of saturated C₁₂ to C₁₈ alcohols with caprylic (octanoic) and capric (decanoic) acids obtained by the reaction of these acids with vegetable saturated fatty alcohols.

CHARACTERS

A slightly yellowish liquid, practically insoluble in water, miscible with alcohol and with liquid paraffin.

It has a relative density of about 0.86, a refractive index of about 1.445 and a viscosity of about 11 mPas.

IDENTIFICATION

- A. Freezing point (2.2.18): not more than 15 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cocoyl caprylocaprate CRS*.

CODEINE

Codeinum

 $C_{18}H_{21}NO_3 \cdot H_2O$ M_r 317.4

DEFINITION

7,8-Didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: soluble in boiling water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 155 °C to 159 °C.

B. To 2.0 ml of solution S (see Tests) add 50 ml of *water R* then 10 ml of 1 M *sodium hydroxide* and dilute to 100.0 ml with *water R*. Examined between 250 nm and 350 nm (2.2.25), the solution shows only 1 absorption maximum at 284 nm. The specific absorbance at the absorption maximum is about 50 (dried substance).

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: dried substance prepared as a disc of *potassium bromide R*.

Comparison: *Ph. Eur. reference spectrum of codeine*.

D. To about 10 mg add 1 ml of *sulphuric acid R* and 0.05 ml of *ferric chloride solution R2* and heat on a water-bath. A blue colour develops. Add 0.05 ml of *nitric acid R*. The colour changes to red.

E. It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7): –142 to –146 (dried substance).

Dissolve 0.50 g in *alcohol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined and 0.100 g of *sodium octanesulphonate R* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *codeine impurity A CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

01/2005:0076 *Reference solution (b)*. Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 0.5 ml of the test solution to 5.0 ml with reference solution (a).

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: end-capped octylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: dissolve 1.08 g of *sodium octanesulphonate R* in a mixture of 20 ml of *glacial acetic acid R* and 250 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 10 μ l.

Run time: 10 times the retention time of codeine.

Relative retention with reference to codeine (retention time = about 6 min): impurity B = about 0.6; impurity E = about 0.7; impurity A = about 2.0; impurity C = about 2.3; impurity D = about 3.6.

System suitability: reference solution (d):

- *resolution*: minimum 3 between the peaks due to codeine and impurity A.

Limits:

- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 0.25,
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *impurities B, C, D, E*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *total of impurities other than A*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): 4.0 per cent to 6.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 10 ml of *anhydrous acetic acid R*. Add 20 ml of *dioxan R*. Titrate with 0.1 M *perchloric acid* using 0.05 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 29.94 mg of $C_{18}H_{21}NO_3$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G.

01/2005:1412

A. R1 = OCH₃, R2 = R3 = H: 7,8-didehydro-4,5α-epoxy-3,6α-dimethoxy-17-methylmorphinan (methylcodeine),

E. R1 = R2 = OH, R3 = H: 7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α,10-diol,

F. R1 = R3 = OH, R2 = H: 7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α,14-diol,

B. morphine,

C. 7,7',8,8'-tetrahydro-4,5α:4',5'α-diepoxy-3,3'-dimethoxy-17,17'-dimethyl-2,2'-bimorphinan-6α,6'α-diol (codeine dimer),

D. 7,8-didehydro-2-[(7,8-didehydro-4,5α-epoxy-6α-hydroxy-17-methylmorphinan-3-yl)oxy]-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol (3-O-(codein-2-yl)morphine),

G. 6,7,8,14-tetrahydro-4,5α-epoxy-3,6-dimethoxy-17-methylmorphinan (thebaine).

CODEINE HYDROCHLORIDE DIHYDRATE

Codeini hydrochloridum dihydricum

C₁₈H₂₂ClNO₃·2H₂O

M_r 371.9

DEFINITION

7,8-Didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol hydrochloride dihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals.

Solubility: soluble in water, slightly soluble in ethanol, practically insoluble in cyclohexane.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of codeine hydrochloride dihydrate.

B. To 5 ml of solution S (see Tests) add 1 ml of a mixture of equal volumes of *strong sodium hydroxide solution R* and *water R* and initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod and cooling in iced water. Wash the precipitate with *water R* and dry at 100-105 °C. It melts (2.2.15) at 155 °C to 159 °C.

C. To about 10 mg add 1 ml of *sulphuric acid R* and 0.05 ml of *ferric chloride solution R2* and heat on a water-bath. A blue colour develops. Add 0.05 ml of *nitric acid R*. The colour changes to red.

D. Solution S gives reaction (a) of chlorides (2.3.1).

E. It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 2.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 5 ml of solution S add 5 ml of *carbon dioxide-free water R*. Add 0.05 ml of *methyl red solution R* and 0.2 ml of 0.02 M *hydrochloric acid*; the solution is red. Add 0.4 ml of 0.02 M *sodium hydroxide*; the solution becomes yellow.

Specific optical rotation (2.2.7): −117 to −121 (anhydrous substance).

Dilute 5.0 ml of solution S to 10.0 ml with *water R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined and 0.100 g of *sodium octanesulphonate R* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *codeine impurity A CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 0.5 ml of the test solution to 5.0 ml with reference solution (a).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** end-capped octylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: dissolve 1.08 g of *sodium octanesulphonate R* in a mixture of 20 ml of *glacial acetic acid R* and 250 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 10 μ l.

Run time: 10 times the retention time of codeine.

Relative retention with reference to codeine (retention time = about 6 min): impurity B = about 0.6; impurity E = about 0.7; impurity A = about 2.0; impurity C = about 2.3; impurity D = about 3.6.

System suitability: reference solution (d):

- **resolution:** minimum 3 between the peaks due to codeine and impurity A.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity C by 0.25,
- **impurity A:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **impurities B, C, D, E:** for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- **total of impurities other than A:** not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphates (2.4.13): maximum 0.1 per cent.

Dilute 5 ml of solution S to 20 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Water (2.5.12): 8.0 per cent to 10.5 per cent, determined on 0.250 g.

ASSAY

Dissolve 0.300 g in a mixture of 5 ml of 0.01 *M hydrochloric acid R* and 30 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 33.59 mg of $C_{18}H_{22}ClNO_3$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G.

A. $R_1 = OCH_3$, $R_2 = R_3 = H$: 7,8-didehydro-4,5 α -epoxy-3,6 α -dimethoxy-17-methylmorphinan (methylcodeine),

E. $R_1 = R_2 = OH$, $R_3 = H$: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,10-diol,

F. $R_1 = R_3 = OH$, $R_2 = H$: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,14-diol,

B. morphine,

C. 7,7',8,8'-tetrahydro-4,5 α :4',5' α -diepoxy-3,3'-dimethoxy-17,17'-dimethyl-2,2'-bimorphinan-6 α ,6' α -diol (codeine dimer),

D. 7,8-didehydro-2-[(7,8-didehydro-4,5 α -epoxy-6 α -hydroxy-17-methylmorphinan-3-yl)oxy]-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol (3-O-(codein-2-yl)morphine),

G. 6,7,8,14-tetrahydro-4,5 α -epoxy-3,6-dimethoxy-17-methylmorphinan (thebaine).

01/2005:0074 pH (2.2.3): 4.0 to 5.0 for solution S.

**CODEINE PHOSPHATE
HEMIHYDRATE**

Codeini phosphas hemihydricus

 $C_{18}H_{24}NO_7P \cdot \frac{1}{2}H_2O$ M_r 406.4**DEFINITION**

7,8-Didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol phosphate hemihydrate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals.

Solubility: freely soluble in water, slightly soluble or very slightly soluble in alcohol.

IDENTIFICATION

First identification: B, E, F.

Second identification: A, C, D, E, F, G.

A. Dilute 1.0 ml of solution S (see Tests) to 100.0 ml with *water R*. To 25.0 ml of this solution add 25 ml of *water R* then 10 ml of 1 M *sodium hydroxide* and dilute to 100.0 ml with *water R*. Examined between 250 nm and 350 nm (2.2.25), the solution shows only 1 absorption maximum, at 284 nm. The specific absorbance at the absorption maximum is about 38 (dried substance).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 0.20 g in 4 ml of *water R*. Add 1 ml of a mixture of equal volumes of *strong sodium hydroxide solution R* and *water R* and initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod and cooling in iced water. Wash the precipitate with *water R* and dry at 100-105 °C. Examine the dried precipitate prepared as discs using *potassium bromide R*.
Comparison: Ph. Eur. reference spectrum of codeine.

C. Dissolve 0.20 g in 4 ml of *water R*. Add 1 ml of a mixture of equal volumes of *strong sodium hydroxide solution R* and *water R* and initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod and cooling in iced water. The precipitate, washed with *water R* and dried at 100-105 °C, melts (2.2.14) at 155 °C to 159 °C.

D. To about 10 mg add 1 ml of *sulphuric acid R* and 0.05 ml of *ferric chloride solution R2* and heat on a water-bath. A blue colour develops. Add 0.05 ml of *nitric acid R*. The colour changes to red.

E. It complies with the test for loss on drying (see Tests).

F. Solution S gives reaction (a) of phosphates (2.3.1).

G. It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 25.0 ml with the same solvent.

pH (2.2.3): 4.0 to 5.0 for solution S.

Specific optical rotation (2.2.7): –98 to –102 (dried substance).

Dilute 5.0 ml of solution S to 10.0 ml with *water R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined and 0.100 g of *sodium octanesulphonate R* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *codeine impurity A CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 0.5 ml of the test solution to 5.0 ml with reference solution (a).

Column:

– *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,

– *stationary phase:* end-capped octylsilyl silica gel for chromatography R (5 µm).

Mobile phase: dissolve 1.08 g of *sodium octanesulphonate R* in a mixture of 20 ml of *glacial acetic acid R* and 250 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 10 µl.

Run time: 10 times the retention time of codeine.

Relative retention with reference to codeine (retention time = about 6 min): impurity B = about 0.6; impurity E = about 0.7; impurity A = about 2.0; impurity C = about 2.3; impurity D = about 3.6.

System suitability: reference solution (d):

– *resolution:* minimum 3 between the peaks due to codeine and impurity A.

Limits:

– *correction factor:* for the calculation of content, multiply the peak area of impurity C by 0.25,

– *impurity A:* not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *impurities B, C, D, E:* for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),

– *any other impurity:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *total of impurities other than A:* not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),

– *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphates (2.4.13): maximum 0.1 per cent.

Dilute 5 ml of solution S to 20 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Loss on drying (2.2.32): 1.5 per cent to 3.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.350 g in a mixture of 10 ml of *anhydrous acetic acid R* and 20 ml of *dioxan R*. Titrate with 0.1 M *perchloric acid* using 0.05 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 39.74 mg of $C_{18}H_{24}NO_7P$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G.

A. R1 = OCH₃, R2 = R3 = H: 7,8-didehydro-4,5 α -epoxy-3,6 α -dimethoxy-17-methylmorphinan (methylcodeine),

E. R1 = R2 = OH, R3 = H: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,10-diol,

F. R1 = R3 = OH, R2 = H: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,14-diol,

B. morphine,

C. 7,7',8,8'-tetrahydro-4,5 α :4',5' α -diepoxy-3,3'-dimethoxy-17,17'-dimethyl-2,2'-bimorphinan-6 α ,6' α -diol (codeine dimer),

D. 7,8-didehydro-2-[(7,8-didehydro-4,5 α -epoxy-6 α -hydroxy-17-methylmorphinan-3-yl)oxy]-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol (3-*O*-(codein-2-yl)morphine),

G. 6,7,8,14-tetrahydro-4,5 α -epoxy-3,6-dimethoxy-17-methylmorphinan (thebaine).

CODEINE PHOSPHATE
SESQUIHYDRATE

Codeini phosphas sesquihydricus

$C_{18}H_{24}NO_7P \cdot 1\frac{1}{2}H_2O$

M_r 424.4

DEFINITION

7,8-Didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol phosphate sesquihydrate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals.

Solubility: freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, E, F.

Second identification: A, C, D, E, F, G.

A. Dilute 1.0 ml of solution S (see Tests) to 100.0 ml with *water R*. To 25.0 ml of this solution add 25 ml of *water R* then 10 ml of 1 M *sodium hydroxide* and dilute to 100.0 ml with *water R*. Examined between 250 nm and 350 nm (2.2.25), the solution shows only 1 absorption maximum, at 284 nm. The specific absorbance at the absorption maximum is about 38 (dried substance).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 0.20 g in 4 ml of *water R*. Add 1 ml of a mixture of equal volumes of *strong sodium hydroxide solution R* and *water R* and initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod and cooling in iced water. Wash the precipitate with *water R* and dry at 100-105 °C. Examine the dried precipitate prepared as discs using *potassium bromide R*.

Comparison: *Ph. Eur.* reference spectrum of codeine.

C. Dissolve 0.20 g in 4 ml of *water R*. Add 1 ml of a mixture of equal volumes of *strong sodium hydroxide solution R* and *water R* and initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod and cooling in iced water. The precipitate, washed with *water R* and dried at 100-105 °C, melts (2.2.14) at 155 °C to 159 °C.

D. To about 10 mg add 1 ml of *sulphuric acid R* and 0.05 ml of *ferric chloride solution R2* and heat on a water-bath. A blue colour develops. Add 0.05 ml of *nitric acid R*. The colour changes to red.

E. It complies with the test for loss on drying (see Tests).

F. Solution S gives reaction (a) of phosphates (2.3.1).

G. It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 25.0 ml with the same solvent.

pH (2.2.3): 4.0 to 5.0 for solution S.

Specific optical rotation (2.2.7): -98 to -102 (dried substance).

Dilute 5.0 ml of solution S to 10.0 ml with *water R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined and 0.100 g of *sodium octanesulphonate R* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *codeine impurity A CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 0.5 ml of the test solution to 5.0 ml with reference solution (a).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *end-capped octylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: dissolve 1.08 g of *sodium octanesulphonate R* in a mixture of 20 ml of *glacial acetic acid R* and 250 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 10 μ l.

Run time: 10 times the retention time of codeine.

Relative retention with reference to codeine (retention time = about 6 min): *impurity B* = about 0.6; *impurity E* = about 0.7; *impurity A* = about 2.0; *impurity C* = about 2.3; *impurity D* = about 3.6.

System suitability: reference solution (d):

- **resolution:** minimum 3 between the peaks due to codeine and *impurity A*.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of *impurity C* by 0.25,
- **impurity A:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **impurities B, C, D, E:** for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- **total of impurities other than A:** not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphates (2.4.13): maximum 0.1 per cent.

Dilute 5 ml of solution S to 20 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Loss on drying (2.2.32): 5.0 per cent to 7.5 per cent, determined on 0.500 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.350 g in a mixture of 10 ml of *anhydrous acetic acid R* and 20 ml of *dioxan R*. Titrate with 0.1 M *perchloric acid* using 0.05 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 39.74 mg of $C_{18}H_{24}NO_7P$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G.

A. $R_1 = OCH_3$, $R_2 = R_3 = H$: 7,8-didehydro-4,5 α -epoxy-3,6 α -dimethoxy-17-methylmorphinan (methylcodeine),

E. $R_1 = R_2 = OH$, $R_3 = H$: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,10-diol,

F. $R_1 = R_3 = OH$, $R_2 = H$: 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α ,14-diol,

B. morphine,

C. 7,7',8,8'-tetrahydro-4,5 α :4',5' α -diepoxy-3,3'-dimethoxy-17,17'-dimethyl-2,2'-bimorphinan-6 α ,6' α -diol (codeine dimer),

D. 7,8-didehydro-2-[(7,8-didehydro-4,5 α -epoxy-6 α -hydroxy-17-methylmorphinan-3-yl)oxy]-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol (3-O-(codein-2-yl)morphine),

G. 6,7,8,14-tetrahydro-4,5 α -epoxy-3,6-dimethoxy-17-methylmorphinan (thebaine).

CODERGOCRINE MESILATE

Codergocrini mesilas

Name	Mol. Formula	M_r	R
dihydroergocornine mesilate	$C_{32}H_{45}N_5O_8S$	660	
dihydroergocristine mesilate	$C_{36}H_{45}N_5O_8S$	708	
α -dihydroergocryptine mesilate	$C_{33}H_{47}N_5O_8S$	674	
β -dihydroergocryptine mesilate	$C_{33}H_{47}N_5O_8S$	674	

DEFINITION

A mixture of:

- (6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2,5-bis(1-methylethyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate (dihydroergocornine mesilate);
- (6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-5-benzyl-10b-hydroxy-2-(1-methylethyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate (dihydroergocristine mesilate);
- (6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate (α -dihydroergocryptine mesilate);
- (6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2-(1-methylethyl)-5-(1*R**S*)-1-methylpropyl]-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate (β -dihydroergocryptine mesilate or epicriptine mesilate).

Content: 98.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains

lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

Appearance: white or yellowish powder.

Solubility: sparingly soluble in water, sparingly soluble to soluble in ethanol (96 per cent), slightly soluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 0.20 g of *methanesulphonic acid R* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Plate: TLC silica gel plate *R*.

Mobile phase: water *R*, concentrated ammonia *R*, butanol *R*, acetone *R* (5:10:20:65 V/V/V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in a current of cold air for not more than 1 min.

Detection: spray with a 1 g/l solution of *bromocresol purple R* in *methanol R*, adjusted to a violet-red colour with 0.05 ml of *dilute ammonia R1*.

Drying: in a current of hot air at 100 °C.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the test for composition.

Results: the 4 principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the 4 principal peaks in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3): 4.2 to 5.2.

Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Composition. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 20 mg of the substance to be examined in a mixture of 1 volume of *anhydrous ethanol R* and 2 volumes of a 10 g/l solution of *tartaric acid R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 20 mg of *codergocrine mesilate CRS* in a mixture of 1 volume of *anhydrous ethanol R* and 2 volumes of a 10 g/l solution of *tartaric acid R* and dilute to 10 ml with the same mixture of solvents.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: triethylamine *R*, acetonitrile *R*, water *R* (2.5:25:75 V/V/V).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 μ l.

Run time: 20 min.

Elution order: dihydroergocornine, α -dihydroergocryptine, dihydroergocristine, β -dihydroergocryptine.

System suitability: test solution:

- resolution: minimum 3 between any 2 consecutive principal peaks.

Composition:

- dihydroergocornine: 30.0 per cent to 35.0 per cent,
- α -dihydroergocryptine: 20.0 per cent to 25.0 per cent,
- dihydroergocristine: 30.0 per cent to 35.0 per cent,
- β -dihydroergocryptine: 10.0 per cent to 13.0 per cent,
- disregard limit: 1.0 per cent.

Related substances. Thin-layer chromatography (2.2.27).

Perform the test as rapidly as possible and protected from direct light. Prepare the test solution last and immediately before application on the plate.

Test solution. Dissolve 0.40 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 40 mg of *dihydroergocristine mesilate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10.0 ml with the same mixture of solvents. Dilute 3.0 ml of the solution to 50.0 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). To 2.0 ml of reference solution (a), add 1.0 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (c). To 1.0 ml of reference solution (a), add 2.0 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (d). To 1.0 ml of reference solution (a), add 5.0 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Plate: TLC silica gel plate *R*.

Mobile phase: concentrated ammonia *R*, *methanol R*, *ethyl acetate R*, *methylene chloride R* (1:3:50:50 V/V/V/V).

Application: 10 μ l.

Drying: in the dark for 2 min after the application of the last solution.

First development: in an unsaturated tank, over 2/3 of the plate.

Drying: in a current of cold air for not more than 1 min.

Second development: in an unsaturated tank, over 2/3 of the plate; use freshly prepared mobile phase.

Drying: in a current of cold air for not more than 1 min.

Detection: spray thoroughly with *dimethylaminobenzaldehyde solution R7* and dry in a current of hot air until the spot in the chromatogram obtained with reference solution (d) is clearly visible.

System suitability: test solution:

- the chromatogram shows at least 3 separated secondary spots.

Limits:

- any impurity: any spots, apart from the principal spot, are not more intense than the spot in the chromatogram obtained with reference solution (a) (0.3 per cent); not more than 4 such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent) and 2 of these may be more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 0.500 g by drying at 120 °C under high vacuum.

ASSAY

Dissolve 0.500 g in 60 ml of *pyridine R*. Pass a stream of *nitrogen R* over the surface of the solution and titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 68.04 mg of *codergocrine mesilate* (average M_r = 680).

STORAGE

Protected from light.

01/2005:1192

COD-LIVER OIL (TYPE A)

Iecoris aselli oleum A

DEFINITION

Purified fatty oil obtained from the fresh livers of *Gadus morhua* L. and other species of *Gadidae*, solid substances being removed by cooling and filtering. A suitable antioxidant may be added.

Content: 600 IU (180 μ g) to 2500 IU (750 μ g) of vitamin A per gram and 60 IU (1.5 μ g) to 250 IU (6.25 μ g) of vitamin D₃ per gram.

CHARACTERS

Appearance: clear, yellowish, viscous liquid.

Solubility: practically insoluble in water, slightly soluble in alcohol, miscible with light petroleum.

IDENTIFICATION

First identification: A, B, C.

Second identification: C, D.

A. In the assay for vitamin A using method A, the test solution shows an absorption maximum (2.2.25) at 325 ± 2 nm. In the assay for vitamin A using method B, the chromatogram obtained with the test solution shows a peak corresponding to the peak of all-*trans*-retinol in the chromatogram obtained with the reference solution.

B. In the assay for vitamin D₃, the chromatogram obtained with test solution (a) shows a peak corresponding to the peak of *cholecalciferol* in the chromatogram obtained with reference solution (b).

C. It complies with the test for composition of fatty acids (see Tests).

D. To 0.1 g add 0.5 ml of *methylene chloride R* and 1 ml of *antimony trichloride solution R*. Mix. A deep blue colour develops in about 10 s.

TESTS

Colour: not more intensely coloured than a reference solution prepared as follows: to 3.0 ml of red primary solution add 25.0 ml of yellow primary solution and dilute to 50.0 ml with a 10 g/l solution of *hydrochloric acid R* (2.2.2, Method II).

Relative density (2.2.5): 0.917 to 0.930.

Refractive index (2.2.6): 1.477 to 1.484.

Acid value (2.5.1): maximum 2.0.

Anisidine value (2.5.36): maximum 30.0.

Iodine value (2.5.4, Method B): 150 to 180.

Use *starch solution R2*.

Peroxide value (2.5.5, Method B): maximum 10.0.

Unsaponifiable matter (2.5.7): maximum 1.5 per cent, determined on 2.0 g, and extracting with 3 quantities, each of 50 ml, of *peroxide-free ether R*.

Stearin. 10 ml remains clear after cooling in iced water for 3 h.

Composition of fatty acids. Gas chromatography (2.2.28).

Trivial name of fatty acid	Nomenclature	Lower limit area (per cent)	Upper limit area (per cent)
<i>Saturated fatty acids:</i>			
Myristic acid	14:0	2.0	6.0
Palmitic acid	16:0	7.0	14.0
Stearic acid	18:0	1.0	4.0
<i>Mono-unsaturated fatty acids:</i>			
Palmitoleic acid	16:1 n-7	4.5	11.5
cis-Vaccenic acid	18:1 n-7	2.0	7.0
Oleic acid	18:1 n-9	12.0	21.0
Gadoleic acid	20:1 n-11	1.0	5.5
Gondoic acid	20:1 n-9	5.0	17.0
Erucic acid	22:1 n-9	0	1.5
Cetoleic acid (22:1 n-11)	22:1 n-11+13	5.0	12.0
<i>Poly-unsaturated fatty acids:</i>			
Linoleic acid	18:2 n-6	0.5	3.0
α-Linolenic acid	18:3 n-3	0	2.0
Morocctic acid	18:4 n-3	0.5	4.5
Timnodonic (eicosapentaenoic) acid (EPA)	20:5 n-3	7.0	16.0
Cervonic (docosahexaenoic) acid (DHA)	22:6 n-3	6.0	18.0

Test solution. Introduce about 0.45 g of the substance to be examined into a 10 ml volumetric flask, dissolve in *hexane R* containing 50 mg of *butylhydroxytoluene R* per litre and dilute to 10.0 ml with the same solvent. Transfer 2.0 ml of the solution into a quartz tube and evaporate the solvent with a gentle current of *nitrogen R*. Add 1.5 ml of a 20 g/l solution of *sodium hydroxide R* in *methanol R*, cover with *nitrogen R*, cap tightly with a polytetrafluoroethylene lined cap, mix and heat in a water-bath for 7 min. Cool, add 2 ml of *boron trichloride-methanol solution R*, cover with *nitrogen R*, cap tightly, mix and heat in a water-bath for 30 min. Cool to 40-50 °C, add 1 ml of *trimethylpentane R*, cap and vortex or shake vigorously for at least 30 s. Immediately add 5 ml of *saturated sodium chloride solution R*, cover with *nitrogen R*, cap and vortex or shake thoroughly for at least 15 s. Allow the upper layer to become clear and transfer to a separate tube. Shake the methanol layer once more with 1 ml of *trimethylpentane R* and combine the trimethylpentane extracts. Wash the combined extracts with 2 quantities, each of 1 ml, of *water R* and dry over *anhydrous sodium sulphate R*. Prepare 2 solutions for each sample.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *hydrogen for chromatography R* or *helium for chromatography R*, where oxygen scrubber is applied.

Split ratio: 1:200.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 55	170 → 225
	55 - 75	225
Injection port		250
Detection		280

Detection: flame ionisation.

Injection: 1 µl, twice.

System suitability:

- the 15 fatty acids to be tested are satisfactorily identified from the chromatogram shown in Figure 1192.-1,
- injection of a mixture of equal amounts of *methyl palmitate R*, *methyl stearate R*, *methyl arachidate R* and *methyl behenate R* give area percentages of 24.4, 24.8, 25.2 and 25.6 (± 0.5 per cent), respectively,
- **resolution:** minimum of 1.3 between the peaks due to methyl oleate and methyl *cis*-vaccenate; the resolution between the pair due to methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.

Calculate the area per cent for each fatty acid methyl ester from the expression:

$$\frac{A_x}{A_t} \times 100$$

A_x = peak area of fatty acid x ,

A_t = sum of the peak areas (up to C22:6 n-3).

The calculation is not valid unless:

- the total area is based only on peaks due to solely fatty acids methyl esters,
- the number of fatty acid methyl ester peaks exceeding 0.05 per cent of the total area is at least 24,
- the 24 largest peaks of the methyl esters account for more than 90 per cent of the total area. (These correspond to, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, 22:6 n-3).

ASSAY

Vitamin A. Carry out the test as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (for example, copper and iron) and acids.

Use method A. If method A is found not to be valid, use method B.

METHOD A

Ultraviolet absorption spectrophotometry (2.2.25).

Test solution. To 1.00 g in a round-bottomed flask, add 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R* and 30 ml of *ethanol R*. Boil under reflux in a current of *nitrogen R* for 30 min. Cool rapidly and add 30 ml of *water R*. Extract with 50 ml of *ether R*. Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 ml, of *water R* and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under

Figure 1192-1. – Chromatogram for the test for composition of fatty acids of cod-liver oil (type A)

reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol R1* to give an expected concentration of vitamin A equivalent to 10-15 IU/ml.

Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A, as all-*trans*-retinol, in International Units per gram from the expression:

$$A_{325} \times \frac{1830}{100m} \times V$$

A_{325} = absorbance at 325 nm,

m = mass of the substance to be examined, in grams,

V = total volume of solution containing 10-15 IU of vitamin A per millilitre,

1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

The above expression can be used only if A_{325} has a value of not greater than $A_{325, \text{corr}}/0.970$ where $A_{325, \text{corr}}$ is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325, \text{corr}} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325, \text{corr}}/0.970$, calculate the content of vitamin A from the following expression:

$$A_{325, \text{corr}} \times \frac{1830}{100m} \times V$$

The assay is not valid unless:

- the wavelength of maximum absorption lies between 323 nm and 327 nm,
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

METHOD B

Liquid chromatography (2.2.29).

Test solution. To 2.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R* and 10 ml of a freshly prepared 800 g/l solution of *potassium hydroxide R* and 100 ml of *ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent V/V solution of *ethanol R* and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 ml volumetric flask and dilute to 25 ml with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent of the unsaponifiable matter of cod-liver oil).

Reference solution (a). Prepare a solution of *retinol acetate CRS* in *2-propanol R1* so that 1 ml contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (a) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) from the following expression, taking into account the assigned content of *retinol acetate CRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

A_{326} = absorbance at 326 nm,

V_1 = volume of reference solution (a) used,

V_2 = volume of the diluted solution,

1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

Reference solution (b). Proceed as described for the test solution but using 2.00 ml of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (b) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml of all-*trans*-retinol and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b) from the expression:

$$A_{325} \times \frac{1830 \times V_3}{100 \times V_4}$$

A_{325} = absorbance at 325 nm,

V_3 = volume of the diluted solution,

V_4 = volume of reference solution (b) used,

1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (film thickness 5-10 μ m).

Mobile phase: water *R*, methanol *R* (3:97 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 325 nm.

Injection: 10 μ l; inject in triplicate the test solution and reference solution (b).

Retention time: all-*trans*-retinol = 5 ± 1 min.

System suitability:

- the chromatogram obtained with the test solution shows a peak due to that of all-*trans*-retinol in the chromatogram obtained with reference solution (b),
- when using the method of standard additions to the test solution there is greater than 95 per cent recovery of the added *retinol acetate CRS*,
- the recovery of all-*trans*-retinol in reference solution (b) as assessed by direct absorption spectrophotometry is greater than 95 per cent.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

A_1 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution,

A_2 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in reference solution (a) as assessed prior to the saponification, in International Units per millilitre (= 1000 IU/ml),

V = volume of reference solution (a) treated (2.00 ml),

m = mass of the substance to be examined in the test solution (2.00 g).

Vitamin D₃. Liquid chromatography (2.2.29). Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Internal standard solution. Dissolve 0.50 mg of *ergocalciferol CRS* in 100 ml of *ethanol R*.

Test solution (a). To 4.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R*, 10 ml of a freshly prepared 800 g/l solution of *potassium hydroxide R* and 100 ml of *ethanol R*. Boil under a reflux condenser on a water-bath for 30 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool the solution to room temperature. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent V/V solution of *ethanol R*, and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in 1.5 ml of the mobile phase described under Purification. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent m/m of the unsaponifiable matter of cod-liver oil).

Test solution (b). To 4.00 g add 2.0 ml of the internal standard solution and proceed as described for test solution (a).

Reference solution (a). Dissolve 0.50 mg of *cholecalciferol CRS* in 100.0 ml of *ethanol R*.

Reference solution (b). In a round-bottomed flask, add 2.0 ml of reference solution (a) and 2.0 ml of the internal standard solution and proceed as described for test solution (a).

PURIFICATION

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: nitrile silica gel for chromatography *R* (film thickness 10 μ m).

Mobile phase: isoamyl alcohol *R*, hexane *R* (1.6:98.4 V/V).

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 265 nm.

Inject 350 μ l of reference solution (b). Collect the eluate from 2 min before until 2 min after the retention time of *cholecalciferol*, in a ground-glass-stoppered tube containing 1 ml of a 1 g/l solution of *butylhydroxytoluene R* in

hexane R. Repeat the procedure with test solutions (a) and (b). Evaporate the eluates obtained from reference solution (b) and from test solutions (a) and (b), separately, to dryness at a temperature not exceeding 30 °C under a gentle current of *nitrogen R*. Dissolve each residue in 1.5 ml of *acetonitrile R*.

DETERMINATION

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (film thickness 5 µm).

Mobile phase: *phosphoric acid R*, 96 per cent V/V solution of *acetonitrile R* (0.2:99.8 V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 265 nm.

Injection: 2 quantities not exceeding 200 µl of each of the 3 solutions obtained under Purification.

System suitability:

- resolution: minimum 1.4 between the peaks corresponding to ergocalciferol and cholecalciferol in the chromatogram obtained with reference solution (b),
- when using the method of standard additions to test solution (a) there is greater than 95 per cent recovery of the added *cholecalciferol CRS* when due consideration has been given to correction by the internal standard.

Calculate the content of vitamin D₃ in International Units per gram using the following expression, taking into account the assigned content of *cholecalciferol CRS*:

$$\frac{A_2}{A_6} \times \frac{A_3}{A_4 - \left[\frac{A_5}{A_1} \right] \times A_2} \times \frac{m_2}{m_1} \times \frac{V_2}{V_1} \times 40$$

- m_1 = mass of the sample in test solution (b) in grams,
 m_2 = total mass of *cholecalciferol CRS* used for the preparation of reference solution (a) in micrograms (500 µg),
 A_1 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with test solution (a),
 A_2 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with test solution (b),
 A_3 = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with reference solution (b),
 A_4 = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with test solution (b),
 A_5 = area (or height) of a possible peak in the chromatogram obtained with test solution (a) with the same retention time as the peak co-eluting with ergocalciferol in test solution (b),
 A_6 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (b),
 V_1 = total volume of reference solution (a) (100 ml),
 V_2 = volume of reference solution (a) used for preparing reference solution (b) (2.0 ml).

STORAGE

In an airtight and well-filled container, protected from light. If no antioxidant is added, store under an inert gas.

Once the container has been opened, its contents are used as soon as possible and any part of the contents not used at once is protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units of vitamin A,
- the number of International Units of vitamin D₃,
- the name and concentration of any added antioxidant.

01/2005:1193

COD-LIVER OIL (TYPE B)

Iecoris aselli oleum B

DEFINITION

Purified fatty oil obtained from the fresh livers of *Gadus morhua* L. and other species of *Gadidae*, solid substances being removed by cooling and filtering. A suitable antioxidant may be added.

Content: 600 IU (180 µg) to 2500 IU (750 µg) of vitamin A per gram and 60 IU (1.5 µg) to 250 IU (6.25 µg) of vitamin D₃ per gram.

CHARACTERS

Appearance: clear, yellowish, viscous liquid.

Solubility: practically insoluble in water, slightly soluble in alcohol, miscible with light petroleum.

IDENTIFICATION

First identification: A, B, C.

Second identification: C, D.

- In the assay for vitamin A using method A, the test solution shows an absorption maximum (2.2.25) at 325 ± 2 nm. In the assay for vitamin A using method B, the chromatogram obtained with the test solution shows a peak corresponding to the peak of all-*trans*-retinol in the chromatogram obtained with the reference solution.
- In the assay for vitamin D₃, the chromatogram obtained with test solution (a) shows a peak corresponding to the peak of cholecalciferol in the chromatogram obtained with reference solution (b).
- It complies with the test for composition of fatty acids (see Tests).
- To 0.1 g add 0.5 ml of *methylene chloride R* and 1 ml of *antimony trichloride solution R*. Mix. A deep blue colour develops in about 10 s.

TESTS

Colour: not more intensely coloured than a reference solution prepared as follows: to 3.0 ml of red primary solution add 25.0 ml of yellow primary solution and dilute to 50.0 ml with a 10 g/l solution of *hydrochloric acid R* (2.2.2, Method II).

Relative density (2.2.5): 0.917 to 0.930.

Refractive index (2.2.6): 1.477 to 1.484.

Acid value (2.5.1): maximum 2.0.

Iodine value (2.5.4, Method B): 150 to 180.

Use *starch solution R2*.

Peroxide value (2.5.5, Method B): maximum 10.0.

Unsaponifiable matter (2.5.7): maximum 1.5 per cent, determined on 2.0 g and extracting with 3 quantities, each of 50 ml, of *peroxide-free ether R*.

Stearin. 10 ml remains clear after cooling in iced water for 3 h.

Composition of fatty acids. Gas chromatography (2.2.28).

Trivial name of fatty acid	Nomenclature	Lower limit area (per cent)	Upper limit area (per cent)
<i>Saturated fatty acids:</i>			
Myristic acid	14:0	2.0	6.0
Palmitic acid	16:0	7.0	14.0
Stearic acid	18:0	1.0	4.0
<i>Mono-unsaturated fatty acids:</i>			
Palmitoleic acid	16:1 n-7	4.5	11.5
<i>cis</i> -Vaccenic acid	18:1 n-7	2.0	7.0
Oleic acid	18:1 n-9	12.0	21.0
Gadoleic acid	20:1 n-11	1.0	5.5
Gondoic acid	20:1 n-9	5.0	17.0
Erucic acid	22:1 n-9	0	1.5
Cetoleic acid (22:1 n-11)	22:1 n-11+13	5.0	12.0
<i>Poly-unsaturated fatty acids:</i>			
Linoleic acid	18:2 n-6	0.5	3.0
α -Linolenic acid	18:3 n-3	0	2.0
Moroctic acid	18:4 n-3	0.5	4.5
Timnodonic (eicosapentaenoic) acid (EPA)	20:5 n-3	7.0	16.0
Cervonic (docosahexaenoic) acid (DHA)	22:6 n-3	6.0	18.0

Test solution. Introduce about 0.45 g of the substance to be examined into a 10 ml volumetric flask, dissolve in *hexane R* containing 50 mg of *butylhydroxytoluene R* per litre and dilute to 10.0 ml with the same solvent. Transfer 2.0 ml of the solution into a quartz tube and evaporate the solvent with a gentle current of *nitrogen R*. Add 1.5 ml of a 20 g/l solution of *sodium hydroxide R* in *methanol R*, cover with *nitrogen R*, cap tightly with a polytetrafluoroethylene lined cap, mix and heat in a water-bath for 7 min. Cool, add 2 ml of *boron trichloride-methanol solution R*, cover with *nitrogen R*, cap tightly, mix and heat in a water-bath for 30 min. Cool to 40-50 °C, add 1 ml of *trimethylpentane R*, cap and vortex or shake vigorously for at least 30 s. Immediately add 5 ml of *saturated sodium chloride solution R*, cover with *nitrogen R*, cap and vortex or shake thoroughly for at least 15 s. Allow the upper layer to become clear and transfer to a separate tube. Shake the methanol layer once more with 1 ml of *trimethylpentane R* and combine the trimethylpentane extracts. Wash the combined extracts with 2 quantities, each of 1 ml, of *water R* and dry over *anhydrous sodium sulphate R*. Prepare 2 solutions for each sample.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 μ m).

Carrier gas: *hydrogen for chromatography R* or *helium for chromatography R*, where oxygen scrubber is applied.

Split ratio: 1:200.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 55	170 → 225
	55 - 75	225
Injection port		250
Detector		280

Detection: flame ionisation.

Injection: 1 μ l, twice.

System suitability:

- the 15 fatty acids to be tested are satisfactorily identified from the chromatogram shown in Figure 1193-1.
- injection of a mixture of equal amounts of *methyl palmitate R*, *methyl stearate R*, *methyl arachidate R*, and *methyl behenate R* give area percentages of 24.4, 24.8, 25.2 and 25.6 (± 0.5 per cent), respectively,
- **resolution:** minimum of 1.3 between the peaks due to methyl oleate and methyl *cis*-vaccenate; the resolution between the pair due to methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.

Calculate the area per cent for each fatty acid methyl ester from the expression:

$$\frac{A_x}{A_t} \times 100$$

A_x = peak area of fatty acid x ,

A_t = sum of the peak areas (up to C22:6 n-3).

The calculation is not valid unless:

- the total area is based only on peaks due to solely fatty acids methyl esters,
- the number of fatty acid methyl ester peaks exceeding 0.05 per cent of the total area is at least 24,
- the 24 largest peaks of the methyl esters account for more than 90 per cent of the total area. (These correspond to, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, 22:6 n-3).

ASSAY

Vitamin A. Carry out the test as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (for example, copper and iron) and acids.

Use method A. If method A is found not to be valid, use method B.

METHOD A

Ultraviolet absorption spectrophotometry (2.2.25).

Test solution. To 1.00 g in a round-bottomed flask, add 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R* and 30 ml of *ethanol R*. Boil under reflux in a current of *nitrogen R* for 30 min. Cool rapidly and add 30 ml of *water R*. Extract with 50 ml of *ether R*. Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 ml, of *water R* and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under

Figure 1193-1. – Chromatogram for the test for composition of fatty acids of cod-liver oil (type B)

reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol R1* to give an expected concentration of vitamin A equivalent to 10-15 IU/ml.

Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A, as all-*trans*-retinol, in International Units per gram from the expression:

$$A_{325} \times \frac{1830}{100m} \times V$$

A_{325} = absorbance at 325 nm,

m = mass of the substance to be examined, in grams,

V = total volume of solution containing 10-15 IU of vitamin A per millilitre,

1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

The above expression can be used only if A_{325} has a value of not greater than $A_{325, \text{corr}}/0.970$ where $A_{325, \text{corr}}$ is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325, \text{corr}} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325, \text{corr}}/0.970$, calculate the content of vitamin A from the expression:

$$A_{325, \text{corr}} \times \frac{1830}{100m} \times V$$

The assay is not valid unless:

- the wavelength of maximum absorption lies between 323 nm and 327 nm,
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

METHOD B

Liquid chromatography (2.2.29).

Test solution. To 2.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R* and 10 ml of a freshly prepared 800 g/l solution of *potassium*

hydroxide R and 100 ml of *ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent V/V solution of *ethanol R* and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 ml volumetric flask and dilute to 25 ml with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent of the unsaponifiable matter of cod-liver oil).

Reference solution (a). Prepare a solution of *retinol acetate CRS* in *2-propanol R1* so that 1 ml contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (a) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) using the following expression, taking into account the assigned content of *retinol acetate CRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

A_{326} = absorbance at 326 nm,

V_1 = volume of reference solution (a) used,

- V_2 = volume of the diluted solution,
 1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

Reference solution (b). Proceed as described for the test solution but using 2.00 ml of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (b) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml of all-*trans*-retinol and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b) from the expression:

$$A_{325} \times \frac{1830 \times V_3}{100 \times V_4}$$

- A_{325} = absorbance at 325 nm,
 V_3 = volume of the diluted solution,
 V_4 = volume of reference solution (b) used,
 1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

Column:

- size: $l = 0.25$ m, $\emptyset = 4.6$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (film thickness 5-10 μ m).

Mobile phase: *water R*, *methanol R* (3:97 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 325 nm.

Injection: 10 μ l; inject in triplicate the test solution and reference solution (b).

Retention time: all-*trans*-retinol = 5 ± 1 min.

System suitability:

- the chromatogram obtained with the test solution shows a peak due to that of all-*trans*-retinol in the chromatogram obtained with reference solution (b),
- when using the method of standard additions to the test solution there is greater than 95 per cent recovery of the added *retinol acetate CRS*,
- the recovery of all-*trans*-retinol in reference solution (b) as assessed by direct absorption spectrophotometry is greater than 95 per cent.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

- A_1 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution,
 A_2 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b),
 C = concentration of *retinol acetate CRS* in reference solution (a) as assessed prior to the saponification, in International Units per millilitre (= 1000 IU/ml),
 V = volume of reference solution (a) treated (2.00 ml),
 m = mass of the substance to be examined in the test solution (2.00 g).

Vitamin D₃. Liquid chromatography (2.2.29). Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Internal standard solution. Dissolve 0.50 mg of *ergocalciferol CRS* in 100 ml of *ethanol R*.

Test solution (a). To 4.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R*, 10 ml of a freshly prepared 800 g/l solution of *potassium hydroxide R* and 100 ml of *ethanol R*. Boil under a reflux condenser on a water-bath for 30 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool the solution to room temperature. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent V/V solution of *ethanol R*, and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in 1.5 ml of the mobile phase described under Purification. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent *m/m* of the unsaponifiable matter of cod-liver oil).

Test solution (b). To 4.00 g add 2.0 ml of the internal standard solution and proceed as described for test solution (a).

Reference solution (a). Dissolve 0.50 mg of *cholecalciferol CRS* in 100.0 ml of *ethanol R*.

Reference solution (b). In a round-bottomed flask, add 2.0 ml of reference solution (a) and 2.0 ml of the internal standard solution and proceed as described for test solution (a).

PURIFICATION

Column:

- size: $l = 0.25$ m, $\emptyset = 4.6$ mm,
- stationary phase: *nitrile silica gel for chromatography R* (film thickness 10 μ m).

Mobile phase: *isoamyl alcohol R*, *hexane R* (1.6:98.4 V/V).

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 265 nm.

Inject 350 μ l of reference solution (b). Collect the eluate from 2 min before until 2 min after the retention time of *cholecalciferol*, in a ground-glass-stoppered tube containing 1 ml of a 1 g/l solution of *butylhydroxytoluene R* in *hexane R*. Repeat the procedure with test solutions (a) and (b). Evaporate the eluates obtained from reference solution (b) and from test solutions (a) and (b), separately, to dryness at a temperature not exceeding 30 °C under a gentle current of *nitrogen R*. Dissolve each residue in 1.5 ml of *acetonitrile R*.

DETERMINATION

Column:

- size: $l = 0.15$ m, $\emptyset = 4.6$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (film thickness 5 μ m).

Mobile phase: phosphoric acid R, a 96 per cent V/V solution of acetonitrile R (0.2:99.8 V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 265 nm.

Injection: 2 quantities not exceeding 200 µl of each of the 3 solutions obtained under Purification.

System suitability:

- **resolution:** minimum 1.4 between the peaks due to ergocalciferol and cholecalciferol in the chromatogram obtained with reference solution (b),
- when using the method of standard additions to test solution (a) there is greater than 95 per cent recovery of the added *cholecalciferol* CRS when due consideration has been given to correction by the internal standard.

Calculate the content of vitamin D₃ in International Units per gram using the following expression, taking into account the assigned content of *cholecalciferol* CRS:

$$\frac{A_2}{A_6} \times \frac{A_3}{A_4 - \left[\frac{A_5}{A_1} \right] \times A_2} \times \frac{m_2}{m_1} \times \frac{V_2}{V_1} \times 40$$

- m_1 = mass of the sample in test solution (b) in grams,
 m_2 = total mass of *cholecalciferol* CRS used for the preparation of reference solution (a) in micrograms (500 µg),
 A_1 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with test solution (a),
 A_2 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with test solution (b),
 A_3 = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with reference solution (b),
 A_4 = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with test solution (b),
 A_5 = area (or height) of a possible peak in the chromatogram obtained with test solution (a) with the same retention time as the peak co-eluting with ergocalciferol in test solution (b),
 A_6 = area (or height) of the peak due to cholecalciferol in the chromatogram obtained with reference solution (b),
 V_1 = total volume of reference solution (a) (100 ml),
 V_2 = volume of reference solution (a) used for preparing reference solution (b) (2.0 ml).

STORAGE

In an airtight and well-filled container, protected from light. If no antioxidant is added, store under an inert gas.

Once the container has been opened, its contents are used as soon as possible and any part of the contents not used at once is protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units of vitamin A,
- the number of International Units of vitamin D₃,
- the name and concentration of any added antioxidant.

COLA

Colae semen

DEFINITION

Cola consists of the whole or fragmented dried seeds, freed from the testa, of *Cola nitida* (Vent.) Schott et Endl. (*C. vera* K. Schum.) and its varieties, as well as of *Cola acuminata* (P. Beauv.) Schott et Endl. (*Sterculia acuminata* P. Beauv.). It contains not less than 1.5 per cent of caffeine (M_r 194.2), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The kernels have an oblong, somewhat obtuse, sub-tetragonal shape, with deformations resulting from mutual pressure inside the fruit; they vary in size and mass, ranging from 5 g to 15 g; the outside is hard, smooth and very dark brown, the inside is more reddish-brown. In *C. nitida* and its varieties, the kernels are divided in two parts, almost plano-convex, corresponding to the cotyledons and usually occurring separated in the commercial drug; the cotyledons are 3 cm to 4 cm long, 2 cm to 2.5 cm wide and 1 cm to 2 cm thick. In *C. acuminata*, the cotyledons are smaller and divided into four to six irregular parts.
- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using a 50 per cent V/V solution of *glycerol* R. The powder shows numerous ovoid or reniform starch granules, 5 µm to 25 µm in size, with concentric striations and a stellate, slightly eccentric hilum; fragments of cotyledon tissue showing large, thick-walled, reddish polygonal cells filled with starch granules; occasional fragments of the external epidermis of the cotyledons.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate* R.
- Test solution.** To 1.0 g of the powdered drug (355), add 5 ml of *alcohol* (60 per cent V/V) R. Shake mechanically at 40 °C for 30 min and filter.

Reference solution (a). Dissolve 25 mg of *caffeine* R in 10 ml of *alcohol* (60 per cent V/V) R.

Reference solution (b). Dissolve 50 mg of *theobromine* R in 10 ml of a mixture of 10 volumes of *water* R, 13 volumes of *methanol* R and 77 volumes of *ethyl acetate* R. Filter.

Apply to the plate as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *water* R, 13 volumes of *methanol* R and 77 volumes of *ethyl acetate* R. Allow the plate to dry in air for 5 min. Examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows two principal quenching zones which are similar in position to the zones in the chromatograms obtained with reference solutions (a) and (b), respectively. Spray the plates with a mixture of equal volumes of *alcohol* R and *hydrochloric acid* R and then with a solution prepared immediately before use by dissolving 1 g of *iodine* R and 1 g of *potassium iodide* R in 100 ml of *alcohol* R. The chromatogram obtained with the test solution shows a reddish-brown principal zone similar in position and colour to the zone in the chromatogram obtained with reference solution (a).

TESTS

01/2005:0758

Foreign matter (2.8.2). It complies with the test for foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 2.00 g of the powdered drug (355) by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16). Not more than 9.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. To 1.00 g (m_1) of the powdered drug (355), add 50 ml of *methanol R*. Heat the mixture under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *methanol R*. Take up the residue with 50 ml of *methanol R*. Proceed as before. Combine the filtrates and the washings in a 200.0 ml volumetric flask and dilute to 200.0 ml with *methanol R*. Transfer 20.0 ml of this solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with the mobile phase, transfer to a 50.0 ml volumetric flask and dilute to 50.0 ml with the mobile phase.

Reference solution. In a 100.0 ml volumetric flask, dissolve 30.0 mg (m_2) of *caffeine R* and 15.0 mg of *theobromine R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Transfer 10.0 ml of this solution to a 100.0 ml volumetric flask and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 25 volumes of *methanol R* and 75 volumes of *water R*,
- as detector a spectrophotometer set at 272 nm,
- a loop injector.

Inject appropriate volumes of each solution. The test is not valid unless: in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding respectively to caffeine and theobromine is at least 2.5. If necessary, adjust the volume of *water R* in the mobile phase.

Calculate the caffeine content using the expression:

$$\frac{m_2 \times A_1 \times 50}{m_1 \times A_2}$$

- A_1 = area of the peak due to caffeine in the chromatogram obtained with the test solution,
- A_2 = area of the peak due to caffeine in the chromatogram obtained with the reference solution,
- m_1 = mass of the drug to be examined in the test solution, in grams,
- m_2 = mass of *caffeine R* in the reference solution, in grams.

STORAGE

Store protected from light.

COLCHICINE

Colchicinum

C₂₂H₂₅NO₆ M_r 399.4

DEFINITION

(-)-N-[(7S,12aS)-1,2,3,10-Tetramethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[a]heptalen-7-yl]acetamide.

Content: 97.0 per cent to 102.0 per cent (anhydrous and ethyl acetate-free substance).

CHARACTERS

Appearance: yellowish-white, amorphous or crystalline powder.

Solubility: very soluble in water, rapidly recrystallising from concentrated solutions as the sesquihydrate, freely soluble in alcohol, practically insoluble in cyclohexane.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Dissolve 5 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with *alcohol R*. Examined between 230 nm and 400 nm (2.2.25), the solution shows 2 absorption maxima, at 243 nm and 350 nm. The ratio of the absorbance measured at 243 nm to that measured at 350 nm is 1.7 to 1.9.
- B. Infrared absorption spectrophotometry (2.2.24).
Preparation: discs of *potassium bromide R*.
Comparison: *colchicine CRS*.
- C. To 0.5 ml of solution S (see Tests) add 0.5 ml of *dilute hydrochloric acid R* and 0.15 ml of *ferric chloride solution R1*. The solution is yellow and becomes dark green on boiling for 30 s. Cool, add 2 ml of *methylene chloride R* and shake. The organic layer is greenish-yellow.
- D. Dissolve about 30 mg in 1 ml of *alcohol R* and add 0.15 ml of *ferric chloride solution R1*. A brownish-red colour develops.

TESTS

Solution S. Dissolve 0.10 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₃ (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Either the solution does not change colour or it becomes green. Not more than 0.1 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Specific optical rotation (2.2.7): -235 to -250 (anhydrous and ethyl acetate-free substance).

Dissolve 50.0 mg in *alcohol R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20.0 mg of *colchicine for system suitability CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (c). Dilute 1 ml of reference solution (b) to 20.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography *R1* (5 μ m).

Mobile phase: mix 450 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate R* and 530 volumes of *methanol R*. After cooling to room temperature, adjust the volume to 1000 ml with *methanol R*. Adjust the apparent pH to 5.5 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of colchicine.

Relative retention with reference to colchicine (retention time = about 7 min): impurity D = about 0.4; impurity E = about 0.7; impurity B = about 0.8; impurity A = about 0.94; impurity C = about 1.2.

System suitability: reference solution (a):

Peak-to-valley ratio: minimum 2, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to colchicine.

Limits:

- **impurity A:** not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Colchicine: maximum 0.2 per cent.

Dissolve 50 mg in *water R* and dilute to 5 ml with the same solvent. Add 0.1 ml of *ferric chloride solution R1*. The solution is not more intensely coloured than a mixture of 1 ml of red primary solution, 2 ml of yellow primary solution and 2 ml of blue primary solution (2.2.2, *Method II*).

Chloroform (2.4.24): maximum 500 ppm.

Ethyl acetate (2.4.24): maximum 6.0 per cent *m/m*.

Water (2.5.12): maximum 2.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.250 g with gentle heating in a mixture of 10 ml of *acetic anhydride R* and 20 ml of *toluene R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 39.94 mg of $C_{22}H_{25}NO_6$.

STORAGE

Protected from light.

IMPURITIES

- A. $R1 = R3 = CH_3$, $R2 = H$: *N*[(7*S*,12*aS*)-1,2,3,10-tetramethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]formamide (*N*-deacetyl-*N*-formylcolchicine),
- E. $R1 = H$, $R2 = R3 = CH_3$: *N*[(7*S*,12*aS*)-3-hydroxy-1,2,10-trimethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]acetamide (3-*O*-demethylcolchicine),
- F. $R1 = R2 = CH_3$, $R3 = H$: *N*[(7*S*,12*aS*)-10-hydroxy-1,2,3-trimethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]acetamide (colchicine),

- B. (-)-*N*[(7*S*,12*aR*)-1,2,3,10-tetramethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]acetamide (conformational isomer),

- C. *N*[(7*S*,7*bR*,10*aS*)-1,2,3,9-tetramethoxy-8-oxo-5,6,7,7*b*,8,10*a*-hexahydrobenzo[*a*]cyclopenta[3,4]-cyclobuta[1,2-*c*]cyclohepten-7-yl]acetamide (β -lumicolchicine),

D. *N*-[(7*S*,12*aS*)-3-(β-*D*-glucopyranosyloxy)-1,2,10-trimethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]acetamide (colchicoside).

01/2005:1775

COLESTYRAMINE

Colestyraminum

DEFINITION

Strongly basic anion-exchange resin in chloride form, consisting of styrene-divinylbenzene copolymer with quaternary ammonium groups.

Nominal exchange capacity: 1.8 g to 2.2 g of sodium glycocholate per gram (dried substance).

CHARACTERS

Appearance: white or almost white, fine powder, hygroscopic.

Solubility: insoluble in water, in methylene chloride and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: colestyramine CRS.

B. It complies with the test for chlorides (see Tests).

TESTS

pH (2.2.3): 4.0 to 6.0.

Suspend 0.100 g in 10 ml of *water R* and allow to stand for 10 min.

Dialysable quaternary amines: maximum 500 ppm, expressed as benzyltrimethylammonium chloride.

Test solution. Place a 25 cm piece of cellulose dialysis tubing having a molecular weight cut-off of 12 000-14 000 and an inflated diameter of 3-6 cm (flat width of 5-9 cm) in *water R* to hydrate until pliable, appropriately sealing one end. Introduce 2.0 g of the substance to be examined into the tube and add 10 ml of *water R*. Seal the tube and completely immerse it in 100 ml of *water R* in a suitable vessel and stir the liquid for 16 h to effect dialysis. Use the dialysate as test solution.

Reference solution. Prepare the reference solution in a similar manner but using 10 ml of a freshly prepared 0.1 g/l solution of *benzyltrimethylammonium chloride R* instead of the substance to be examined.

Transfer 5.0 ml of the test solution to a separating funnel and add 5 ml of a 3.8 g/l solution of *disodium tetraborate R*, 1 ml of a solution containing 1.5 g/l of *bromothymol blue R* and 4.05 g/l of *sodium carbonate R* and 10 ml of *chloroform R*. Shake the mixture vigorously for 1 min, allow the phases to separate and transfer the clear organic layer to a 25 ml volumetric flask. Repeat the extraction with a further 10 ml of *chloroform R*, combine the organic layers and dilute to 25 ml with *chloroform R*. Measure the absorbance (2.2.25) of

the solution at the absorption maximum at 420 nm, using as compensation liquid a solution prepared in the same manner but using 5.0 ml of *water R* instead of the test solution.

Repeat the operation using 5.0 ml of the reference solution.

The absorbance obtained with the test solution is not greater than that obtained with the reference solution.

Impurity A. Liquid chromatography (2.2.29).

Test solution. Shake 5.0 g with 10 ml of *acetone R* for 30 min. Centrifuge and use the supernatant liquid.

Reference solution (a). Dissolve 5 mg of *styrene R* in *acetone R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *acetone R*.

Reference solution (b). Dissolve 0.35 ml of *styrene R* in *acetone R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *acetone R*.

Reference solution (c). Dissolve 0.35 ml of *toluene R* in *acetone R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Mix 1.0 ml of reference solution (b) and 1.0 ml of reference solution (c) with *acetone R* and dilute to 100.0 ml with the same solvent.

Column:

- **size:** $l = 0.30$ m, $\varnothing = 3.9$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (10 μ m) with a specific surface area of 330 m²/g and a pore size of 12.5 nm.

Mobile phase: *acetonitrile R*, *water R* (50:50 V/V).

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l of test solution, reference solutions (a) and (d).

System suitability: reference solution (d):

- **resolution:** minimum 1.5 between the peaks due to impurity A and toluene.

Limit:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 ppm).

Chloride: 13.0 per cent to 17.0 per cent (dried substance).

To 0.2 g add 100 ml of *water R* and 50 mg of *potassium nitrate R*. Add, with stirring, 2 ml of *nitric acid R* and titrate with 0.1 *M silver nitrate*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M silver nitrate* is equivalent to 3.55 mg of Cl.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 12 per cent, determined on 1.000 g by drying in an oven at 70 °C over *diphosphorus pentoxide R* at a pressure not exceeding 7 kPa for 16 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Exchange capacity. Liquid chromatography (2.2.29).

Solution A. Dissolve 1.500 g of *sodium glycocholate R* in a solution containing 4 g/l of *potassium dihydrogen phosphate R* and 12 g/l of *dipotassium hydrogen phosphate R* and dilute to 100.0 ml with the same solution.

Test solution. Add 20.0 ml of solution A to a quantity of the substance to be examined equivalent to about 0.100 g of the dried substance. Shake mechanically for 2 h and centrifuge for 15 min. Dilute 5.0 ml of the supernatant liquid to 50.0 ml with *water R*.

Reference solution (a). Dilute 4.0 ml of solution A to 100.0 ml with *water R*.

Reference solution (b). Dissolve 60 mg of *sodium glycocholate R* and 30 mg of *sodium taurodeoxycholate R* in *water R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of a 10.9 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 50 μ l.

Run time: twice the retention time of glycocholate.

System suitability: reference solution (b):

- **resolution:** minimum 1.5 between the peaks due to glycocholate and taurodeoxycholate.

Calculate the nominal exchange capacity using the following expression:

$$\frac{(2.5 A_1 - A_2) \times m_1 \times 0.73}{12.5 \times A_1 \times m_2}$$

- A_1 = area of the peak due to glycocholate in the chromatogram obtained with reference solution (a),
- A_2 = area of the peak due to glycocholate in the chromatogram obtained with the test solution,
- m_1 = mass, in milligrams, of *sodium glycocholate R* used in the preparation of solution A,
- m_2 = mass, in milligrams, of the dried substance to be examined used in the preparation of the test solution,
- 0.73 = correction factor to convert the true exchange capacity to the conventionally used nominal exchange capacity.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A.

A. styrene.

01/2005:0319

COLISTIMETHATE SODIUM

Colistimethatum natricum

DEFINITION

Colistimethate sodium is prepared from colistin by the action of formaldehyde and sodium hydrogen sulphite. The potency is not less than 11 500 IU/mg, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 5 mg of the substance to be examined in 1 ml of a mixture of equal volumes of *hydrochloric acid R* and *water R*. Heat at 135 °C in a sealed tube for 5 h. Evaporate to dryness on a water-bath and continue the heating until the hydrochloric acid has evaporated. Dissolve the residue in 0.5 ml of *water R*.

Reference solution (a). Dissolve 20 mg of *leucine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *threonine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 20 mg of *phenylalanine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (d). Dissolve 20 mg of *serine R* in *water R* and dilute to 10 ml with the same solvent.

Carry out the following procedures protected from light.

Apply to the plate as 10 mm bands 5 μ l of each solution. Place the plate in the chromatographic tank so that it is not in contact with the mobile phase consisting of a mixture of 25 volumes of *water R* and 75 volumes of *phenol R*. Leave the plate to become impregnated with the vapour of the solvent for at least 12 h. Develop over a path of 12 cm using the same mobile phase. Dry the plate at 100–105 °C and spray with *ninhydrin solution R1*. Heat at 110 °C for 5 min. The chromatogram obtained with the test solution shows zones corresponding to those in the chromatograms obtained with reference solutions (a) and (b), but shows no zones corresponding to those in the chromatograms obtained with reference solutions (c) and (d). The chromatogram obtained with the test solution also shows a zone with a very low R_f value (2,4-diaminobutyric acid).

B. Dissolve about 5 mg in 3 ml of *water R*. Add 3 ml of *dilute sodium hydroxide solution R*. Shake and add 0.5 ml of a 10 g/l solution of *copper sulphate R*. A violet colour is produced.

C. Dissolve about 50 mg in 1 ml of 1 M *hydrochloric acid* and add 0.5 ml of 0.01 M *iodine*. The solution is decolourised and gives reaction (a) of sulphates (2.3.1).

D. It gives reaction (b) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 0.16 g in 10 ml of *water R*. The solution is clear (2.2.1).

pH (2.2.3). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution, measured after 30 min, is 6.5 to 8.5.

Specific optical rotation (2.2.7). Dissolve 1.25 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is –46 to –51, calculated with reference to the dried substance.

Free colistin. Dissolve 80 mg in 3 ml of *water R*. Add 0.1 ml of a 100 g/l solution of *silicotungstic acid R*; 10 s to 20 s after addition of the reagent, the solution is not more opalescent than reference suspension II (2.2.1).

Total sulphite. *Work in a fume cupboard.* Dissolve 0.100 g in 50 ml of *water R* and add 5 ml of a 100 g/l solution of *sodium hydroxide R* and 0.3 g of *potassium cyanide R*. Boil gently for 3 min and then cool. Neutralise with 0.5 M *sulphuric acid* using 0.2 ml of *methyl orange solution R* as indicator. Add an excess of 0.5 ml of the acid and 0.2 g of *potassium iodide R*. Titrate with 0.05 M *iodine* using 1 ml of *starch solution R* as indicator. The volume of 0.05 M *iodine* used in the titration is 5.5 ml to 7.0 ml.

Reference solution (a). Dissolve 25.0 mg of *colistin sulphate CRS* in 40 ml of *water R* and dilute to 50.0 ml with *acetonitrile R*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: *end-capped octadecylsilyl silica gel for chromatography R* (3.5 μ m),
- temperature: 30 °C.

Mobile phase: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution prepared as follows: dissolve 4.46 g of *anhydrous sodium sulphate R* in 900 ml of *water R*, add 2.5 ml of *phosphoric acid R* and dilute to 1000 ml with *water R* (pH 2.3 to 2.5).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 μ l.

Run time: 1.5 times the retention time of colistin E1.

Relative retention with reference to colistin E1 (retention time = about 16 min): colistin E2 = about 0.45; colistin E3 = about 0.5; colistin E1-I = about 0.8; colistin E1-7MOA = about 1.1.

System suitability: reference solution (a):

- **resolution:** minimum 8.0 between the peaks due to colistin E2 and colistin E1, minimum 6.0 between the peaks due to colistin E2 and colistin E1-I, minimum 2.5 between the peaks due to colistin E1-I and colistin E1, minimum 1.5 between the peaks due to colistin E1 and colistin E1-7MOA,
- the chromatogram obtained is concordant with the chromatogram supplied with *colistin sulphate CRS*.

Limits:

- **any impurity:** maximum 4.0 per cent,
- **total:** maximum 23.0 per cent,
- **disregard limit:** the area of the peak due to colistin E1 in the chromatogram obtained with reference solution (b); disregard the peaks due to colistin E2, E3, E1-I, E1 and E1-7MOA.

Sulphate: 16.0 per cent to 18.0 per cent (dried substance).

Dissolve 0.250 g in 100 ml of *water R* and adjust to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate*, adding 50 ml of *alcohol R* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of SO_4 .

Loss on drying (2.2.32): maximum 3.5 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of the sum of colistins E2, E3, E1-I, E1 and E1-7MOA, the percentage content of colistin E3, the percentage content of colistin E1-I and

the percentage content of colistin E1-7MOA using the chromatogram obtained with reference solution (a) and the declared contents of *colistin sulphate CRS*.

STORAGE

In an airtight container, protected from light.

01/2005:1862

COLOPHONY

Colophonium

DEFINITION

Residue remaining after distillation of the volatile oil from the oleoresin obtained from various species of *Pinus*.

CHARACTERS

Macroscopic characters described under identification A.

IDENTIFICATION

A. Translucent, pale yellow to brownish-yellow, angular, irregularly-shaped, brittle, glassy pieces of different sizes the surfaces of which bear conchoidal markings.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 1 g in 10 ml of *methanol R* by gently warming.

Reference solution. Dissolve 10 mg of *thymol R* and 10 mg of *linalol R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R*.

Application: 10 μ l, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

Top of the plate	
 Thymol: an orange band Linalol: a purple band	A purple band
	A purple band
	2 purple bands
	Sequence of narrow purple bands
Reference solution	Test solution
	Purple extended baseline band

TESTS

Acid value (2.5.1): 145 to 180, determined on 1.0 g.

Foreign matter (2.8.2): maximum 2 per cent.

Total ash (2.4.16): maximum 0.2 per cent.

STORAGE

Do not reduce to a powder.

01/2005:0891 *Reference solution.* Dissolve 0.140 g of *acetaldehyde ammonia trimer trihydrate R* in *water R* and dilute to 200.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *phosphate buffer solution pH 9.0 R*.

COPOVIDONE

Copovidonum

$(C_6H_9NO)_n, (C_4H_6O_2)_m$

$M_r (111.1)_n + (86.1)_m$

DEFINITION

Copovidone is a copolymer of 1-ethenylpyrrolidin-2-one and ethenyl acetate in the mass proportion 3:2.

Content:

- nitrogen (N; A_r 14.01): 7.0 per cent to 8.0 per cent (dried substance),
- ethenyl acetate $C_4H_6O_2$; M_r 86.10): 35.3 per cent to 42.0 per cent (dried substance).

K-value: 90.0 per cent to 110.0 per cent of the value stated on the label.

CHARACTERS

Aspect: white or yellowish-white powder or flakes, hygroscopic.

Solubility: freely soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of copovidone.

B. To 1 ml of solution S (see Tests) add 5 ml of *water R* and 0.2 ml of 0.05 M iodine. A red colour appears.

C. Dissolve 0.7 g of *hydroxylamine hydrochloride R* in 10 ml of *methanol R*, add 20 ml of a 40 g/l solution of *sodium hydroxide R* and filter if necessary. To 5 ml of the solution add 0.1 g of the substance to be examined and boil for 2 min. Transfer 50 µl to a filter paper and add 0.1 ml of a mixture of equal volumes of *ferric chloride solution R1* and *hydrochloric acid R*. A violet colour appears.

TESTS

Solution S. Dissolve 10 g in *water R* and dilute to 100 ml with the same solvent. Add the substance to be examined to the *water R* in small portions with constant stirring.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1) and not more intensely coloured than reference solution B₅, R₅ or BY₅ (2.2.2, Method II).

Aldehydes: maximum 500 ppm, expressed as acetaldehyde.

Test solution. Dissolve 1.0 g of the substance to be examined in *phosphate buffer solution pH 9.0 R* and dilute to 100.0 ml with the same solvent. Stopper the flask and heat at 60 °C for 1 h. Allow to cool.

Into 3 identical spectrophotometric cells with a path length of 1 cm, introduce separately 0.5 ml of the test solution, 0.5 ml of the reference solution and 0.5 ml of *water R* (blank). To each cell, add 2.5 ml of *phosphate buffer solution pH 9.0 R* and 0.2 ml of *nicotinamide-adenine dinucleotide solution R*. Mix and stopper tightly. Allow to stand at 22 ± 2 °C for 2-3 min and measure the absorbance (2.2.25) of each solution at 340 nm, using *water R* as the compensation liquid. To each cell, add 0.05 ml of *aldehyde dehydrogenase solution R*, mix and stopper tightly. Allow to stand at 22 ± 2 °C for 5 min. Measure the absorbance of each solution at 340 nm using *water R* as compensation liquid. Determine the content of aldehydes using the expression:

$$\frac{(A_{t2} - A_{t1}) - (A_{b2} - A_{b1})}{(A_{s2} - A_{s1}) - (A_{b2} - A_{b1})} \times \frac{100\,000 \times C}{m}$$

A_{t1} = absorbance of the test solution before the addition of aldehyde dehydrogenase,

A_{t2} = absorbance of the test solution after the addition of aldehyde dehydrogenase,

A_{s1} = absorbance of the reference solution before the addition of aldehyde dehydrogenase,

A_{s2} = absorbance of the reference solution after the addition of aldehyde dehydrogenase,

A_{b1} = absorbance of the blank before the addition of aldehyde dehydrogenase,

A_{b2} = absorbance of the blank after the addition of aldehyde dehydrogenase,

m = mass of povidone, in grams, calculated with reference to the dried substance,

C = concentration (mg/ml), of acetaldehyde in the reference solution, calculated from the weight of the acetaldehyde ammonia trimer trihydrate with the factor 0.72.

Peroxides: maximum 400 ppm, expressed as H_2O_2 .

Dilute 10 ml of solution S to 25 ml with *water R*. Add 2 ml of *titanium trichloride-sulphuric acid reagent R* and allow to stand for 30 min. The absorbance (2.2.25) of the solution, measured at 405 nm using a mixture of 25 ml of a 40 g/l solution of the substance to be examined and 2 ml of a 13 per cent V/V solution of *sulphuric acid R* as the compensation liquid, is not greater than 0.35.

Hydrazine. Thin-layer chromatography (2.2.27). Use freshly prepared solutions.

Test solution. To 25 ml of solution S add 0.5 ml of a 50 g/l solution of *salicylaldehyde R* in *methanol R*, mix and heat in a water-bath at 60 °C for 15 min. Allow to cool, add 2.0 ml of *xylene R*, shake for 2 min and centrifuge. Use the clear supernatant layer.

Reference solution. Dissolve 9 mg of *salicylaldehydeazine R* in *xylene R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *xylene R*.

Plate: TLC silanised silica gel plate R.

Mobile phase: *water R*, *methanol R* (20:80 V/V).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Limit:

- *hydrazine*: any spot corresponding to salicylaldehyde azine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1 ppm).

Monomers: maximum 0.1 per cent.

Dissolve 10.0 g in 30 ml of *methanol R* and add slowly 20.0 ml of *iodine bromide solution R*. Allow to stand for 30 min protected from light with repeated shaking. Add 10 ml of a 100 g/l solution of *potassium iodide R* and titrate with 0.1 M *sodium thiosulphate* until a yellow colour is obtained. Continue titration dropwise until the solution becomes colourless. Carry out a blank titration. Not more than 1.8 ml of 0.1 M *sodium thiosulphate* is used.

Impurity A. Liquid chromatography (2.2.29).

Test solution. Dissolve 100 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 100 mg of 2-pyrrolidone *R* in *water R* and dilute to 100 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *water R*.

Precolumn:

- *size*: $l = 0.025$ m, $\varnothing = 4$ mm,
- *stationary phase*: end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m).

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: spherical aminohexadecylsilyl silica gel for chromatography *R* (5 μ m),
- *temperature*: 30 °C.

Mobile phase: *water R*, adjusted to pH 2.4 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm. A detector is placed between the precolumn and the analytical column. A second detector is placed after the analytical column.

Injection: 10 μ l. When impurity A has left the precolumn (after about 1.2 min) switch the flow directly from the pump to the analytical column. Before the next chromatogram is run, wash the precolumn by reversed flow.

Limit:

- *impurity A*: not more than the area of the principal peak obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

Viscosity, expressed as *K*-value. Dilute 5.0 ml of solution S to 50.0 ml with *water R*. Allow to stand for 1 h and determine the viscosity (2.2.9) of the solution at 25 ± 0.1 °C using viscometer No. 1 with a minimum flow time of 100 s. Calculate the *K*-value from the expression:

$$\frac{1.5 \log \eta - 1}{0.15 + 0.003c} + \frac{\sqrt{300c \log \eta + (c + 1.5c \log \eta)^2}}{0.15c + 0.003c^2}$$

c = percentage concentration (g/100 ml) of the substance to be examined, calculated with reference to the dried substance,

η = viscosity of the solution relative to that of water.

ASSAY

Ethenyl acetate. Determine the saponification value (2.5.6) on 2.00 g of the substance to be examined. Multiply the result obtained by 0.1534 to obtain the percentage content of the ethenyl acetate component.

Nitrogen. Carry out the determination of nitrogen (2.5.9) using 30.0 mg of the substance to be examined and 1 g of a mixture of 3 parts of *copper sulphate R* and 997 parts of *dipotassium sulphate R*, heating until a clear, light green solution is obtained and then for a further 45 min.

STORAGE

In an airtight container.

LABELLING

The label states the *K*-value.

IMPURITIES

A. pyrrolidin-2-one (2-pyrrolidone).

01/2005:0893

COPPER SULPHATE, ANHYDROUS**Cupri sulfas anhydricus**

CuSO₄

M_r 159.6

DEFINITION

Anhydrous copper sulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of CuSO₄, calculated with reference to the dried substance.

CHARACTERS

A greenish-grey powder, very hygroscopic, freely soluble in water, slightly soluble in methanol, practically insoluble in alcohol.

IDENTIFICATION

- Add several drops of *dilute ammonia R2* to 1 ml of solution S (see Tests). A blue precipitate is formed on further addition of *dilute ammonia R2*, the precipitate dissolves and a dark blue colour is produced.
- It complies with the test for loss on drying (see Tests).
- Dilute 1 ml of solution S to 5 ml with *water R*. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 1.6 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (150 ppm). Examine the tubes laterally against a black background.

Iron. Not more than 150 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.32 g in 10 ml of *water R*, add 2.5 ml of *lead-free nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, adding 2.5 ml of *lead-free nitric acid R* and diluting to 25.0 ml with *water R*.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as a source of radiation and an air-butane flame.

Lead. Not more than 80 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.6 g in 10 ml of *water R*, add 2.5 ml of *lead-free nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (100 ppm Pb) R*, adding 2.5 ml of *lead-free nitric acid R* and diluting to 25.0 ml with *water R*.

Measure the absorbance at 217.0 nm using a lead hollow-cathode lamp as a source of radiation and an air-butane flame.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 250 °C.

ASSAY

Dissolve 0.125 g in 50 ml of *water R*. Add 2 ml of *sulphuric acid R* and 3 g of *potassium iodide R*. Titrate with 0.1 M *sodium thiosulphate*, using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 15.96 mg of CuSO_4 .

STORAGE

Store in an airtight container.

B. It complies with the test for loss on drying (see Tests).

C. Dilute 1 ml of solution S to 5 ml with *water R*. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 5 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm). Examine the tubes laterally against a black background.

Iron. Not more than 100 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.5 g in 10 ml of *water R*, add 2.5 ml of *lead-free nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, adding 2.5 ml of *lead-free nitric acid R* and diluting to 25.0 ml with *water R*.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as a source of radiation and an air-butane flame.

Lead. Not more than 50 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.5 g in 10 ml of *water R*, add 2.5 ml of *lead-free nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (100 ppm Pb) R*, adding 2.5 ml of *lead-free nitric acid R* and diluting to 25.0 ml with *water R*.

Measure the absorbance at 217.0 nm using a lead hollow-cathode lamp as a source of radiation and an air-butane flame.

Loss on drying (2.2.32): 35.0 per cent to 36.5 per cent, determined on 0.500 g by drying in an oven at 250 °C.

ASSAY

Dissolve 0.200 g in 50 ml of *water R*. Add 2 ml of *sulphuric acid R* and 3 g of *potassium iodide R*. Titrate with 0.1 M *sodium thiosulphate*, adding 1 ml of *starch solution R* towards the end of the titration.

1 ml 0.1 M *sodium thiosulphate* is equivalent to 24.97 mg of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$.

01/2005:0894

COPPER SULPHATE PENTAHYDRATE

Cupri sulfas pentahydricus

 $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ M_r 249.7

DEFINITION

Copper sulphate pentahydrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$.

CHARACTERS

A blue, crystalline powder or transparent, blue crystals, freely soluble in water, soluble in methanol, practically insoluble in alcohol.

IDENTIFICATION

A. Add several drops of *dilute ammonia R2* to 1 ml of solution S (see Tests). A blue precipitate is formed on further addition of *dilute ammonia R2*, the precipitate dissolves and a dark blue colour is produced.

01/2005:1304

CORIANDER

Coriandri fructus

DEFINITION

Coriander consists of the dried cremocarp of *Coriandrum sativum* L. It contains not less than 3 ml/kg of essential oil, calculated with reference to the dried drug.

CHARACTERS

The cremocarp is brown or light brown and is more or less spherical, about 1.5 mm to 5 mm in diameter, or oval form 2 mm to 6 mm long.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The mericarps are usually tightly connected. The cremocarp is glabrous and has ten wavy, slightly raised primary ridges and eight straight, more prominent

01/2005:1820

secondary ridges. The stylopod crowns the apex. The mericarps are concave on the internal surface. A small fragment of the pedicel may be present.

- B. Reduce to a powder (355). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous oil droplets; fragments of endosperm with small thick-walled regular cells containing microcrystals and microrosettes of calcium oxalate and oil droplets; fragments of endocarp with very narrow cells having a parquetry arrangement and usually associated with a layer of thin-walled rectangular sclereids of the mesocarp; fragments from the sclerenchymatous layer of the mesocarp with short, strongly thickened, pitted, fusiform cells occurring in layers with the cells of adjacent layers approximately at right angles to one another; fragments of parenchyma with small, thick-walled cells; occasional fragments of vascular bundles.
- C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.
- Test solution.** Shake 0.50 g of the freshly powdered drug (355) with 5.0 ml of *hexane R* for 2 min to 3 min and filter over 2 g of *anhydrous sodium sulphate R*.
- Reference solution.** Dissolve 15 µl of *linalol R* and 25 µl of *olive oil R* in 5.0 ml of *hexane R* immediately before use.
- Apply to the plate as bands 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow the plate to dry in air and develop again in the same conditions. Allow the plate to dry in air. Spray the plate with *anisaldehyde solution R* and examine in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The chromatogram obtained with the reference solution shows in the lower half a violet to greyish-violet zone (linalol) and in the upper half a bluish-violet zone (triglycerides). The chromatogram obtained with the test solution shows zones similar in position and colour to the zones in the chromatogram obtained with the reference solution. Several violet-grey to brownish zones, including the zone corresponding to geraniol, are between the starting point and the zone due to linalol in the chromatogram obtained with the reference solution. It may also show several faint violet-grey zones between the zone due to triglycerides and that due to linalol in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter. None of the cremocarps show perforations due to animals.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 8.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a coarse powder and immediately use 30.0 g for the determination. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

STORAGE

Store protected from light.

CORIANDER OIL

Coriandri aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fruits of *Coriandrum sativum* L.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

It has a characteristic spicy odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Examine by thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 µl of the substance to be examined in 1.0 ml of *toluene R*.

Reference solution. Dissolve 10 µl *linalol R* and 2 µl of *geranyl acetate R* in 1.0 ml of *toluene R*.

Plate: TLC silica gel plate R.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 10 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10-15 min. Examine immediately in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Geranyl acetate: a violet-blue zone	A violet-blue zone (geranyl acetate)
Linalol: an intense violet zone	An intense violet zone (linalol) A violet-blue zone (geraniol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.860 to 0.880.

Refractive index (2.2.6): 1.462 to 1.470.

Optical rotation (2.2.7): + 7° to + 13°.

Acid value (2.5.1): maximum 3.0, determined on 5.00 g of the substance to be examined.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dissolve 10 µl of α -pinene R, 10 µl of limonene R, 10 µl of γ -terpinene R, 10 µl of *p*-cymene R, 10 mg of camphor R, 20 µl of linalol R, 10 µl of α -terpineol R, 10 µl of geranyl acetate R and 10 µl of geraniol R in 1 ml of hexane R.

Reference solution (b). Dissolve 5 µl of geraniol R in hexane R and dilute to 10 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** *l* = 60 m, Ø = 0.25 mm,
- **stationary phase:** macrogol 20 000 R (film thickness 0.25 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1 ml/min.

Split ratio: 1:65.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10 10 - 75 75 - 120	60 60 → 190 190
Injection port		220
Detector		240

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability: reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to linalol and camphor.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- **α -pinene:** 3.0 per cent to 7.0 per cent,
- **limonene:** 1.5 per cent to 5.0 per cent,
- **γ -terpinene:** 1.5 per cent to 8.0 per cent,
- ***p*-cymene:** 0.5 per cent to 4.0 per cent,
- **camphor:** 3.0 per cent to 6.0 per cent,
- **linalol:** 65.0 per cent to 78.0 per cent,
- **α -terpineol:** 0.1 per cent to 1.5 per cent,
- **geranyl acetate:** 0.5 per cent to 4.0 per cent,
- **geraniol:** 0.5 per cent to 3.0 per cent,
- **disregard limit:** area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chiral purity. Gas chromatography (2.2.28).

Test solution. Dissolve 0.02 g of the substance to be examined in pentane R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 µl of linalol R and 5 mg of borneol R in pentane R and dilute to 10 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** *l* = 25 m, Ø = 0.25 mm,
- **stationary phase:** modified β -cyclodextrin for chiral chromatography R (film thickness 0.25 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1.3 ml/min.

Split ratio: 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution:

- **resolution:** minimum 5.5 between the peaks due to (*R*)-linalol (1st peak) and (*S*)-linalol (2nd peak) and minimum 2.9 between the peaks due to (*S*)-linalol and borneol (3rd peak).

Limit: calculate the percentage content of (*R*)-linalol from the expression:

$$\frac{A_R}{A_S + A_R} \times 100$$

A_S = area of the peak due to (*S*)-linalol,

A_R = area of the peak due to (*R*)-linalol.

- **(*R*)-linalol:** maximum 14 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2005:0321

CORTISONE ACETATE

Cortisoni acetat

$C_{23}H_{30}O_6$

M_r 402.5

DEFINITION

Cortisone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 17-hydroxy-3,11,20-trioxopregn-4-en-21-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, soluble in dioxan, sparingly soluble in acetone, slightly soluble in alcohol and in methanol.

It shows polymorphism.

IDENTIFICATION

First identification: A, B.

Second identification: C, D, E.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cortisone acetate CRS*. If the spectra obtained in the solid state show differences, record new spectra using 50 g/l solutions of the substance to be examined and of the reference substance in *methylene chloride R* in a 0.2 mm cell.

- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *cortisone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *hydrocortisone acetate R* in reference solution (a) and dilute to 10 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2.5 h. Allow to cool.

Reference solution (a). Dissolve 25 mg of *cortisone acetate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly

through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2.5 h. Allow to cool.

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an *R_f* value distinctly lower than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a faint yellow colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.

- E. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 211 to + 220, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *cortisone acetate CRS* and 2 mg of *hydrocortisone acetate CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 400 ml of *acetonitrile R* with 550 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: hydrocortisone acetate about

10 min and cortisone acetate about 12 min. The test is not valid unless the resolution between the peaks due to hydrocortisone acetate and cortisone acetate is at least 4.2; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject 20 µl of the test solution, 20 µl of reference solution (b) and 20 µl of acetonitrile as a blank. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum of 237 nm.

Calculate the content of $C_{23}H_{30}O_6$ taking the specific absorbance to be 395.

STORAGE

Store protected from light.

IMPURITIES

A. hydrocortisone acetate.

01/2005:0036

COTTON, ABSORBENT

Lanugo gossypii absorbens

DEFINITION

Absorbent cotton consists of new fibres or good quality combers obtained from the seed-coat of various species of the genus *Gossypium* L., cleaned, purified, bleached and carefully carded. It may not contain any compensatory colouring matter.

CHARACTERS

It is white and is composed of fibres of average length not less than 10 mm, determined by a suitable method, and contains not more than traces of leaf residue, pericarp, seed-coat or other impurities. It offers appreciable resistance when pulled. It does not shed any appreciable quantity of dust when gently shaken.

IDENTIFICATION

- Examined under a microscope, each fibre is seen to consist of a single cell, up to about 4 cm long and up to 40 µm wide, in the form of a flattened tube with thick and rounded walls and often twisted.
- When treated with *iodinated zinc chloride solution R*, the fibres become violet.
- To 0.1 g add 10 ml of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It does not dissolve.

TESTS

Solution S. Place 15.0 g in a suitable vessel, add 150 ml of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 ml of the solution for the test for surface-active substances and filter the remainder.

Acidity or alkalinity. To 25 ml of solution S add 0.1 ml of *phenolphthalein solution R* and to another 25 ml add 0.05 ml of *methyl orange solution R*. Neither solution is pink.

Foreign fibres. Examined under a microscope, it is seen to consist exclusively of typical cotton fibres, except that occasionally a few isolated foreign fibres may be present.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence and a few yellow particles. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

Neps. Spread about 1 g evenly between 2 colourless transparent plates each 10 cm square. Examine for neps by transmitted light and compare with *Absorbent cotton RM*. The product to be examined is not more neppy than the standard.

Absorbency

Apparatus. A dry cylindrical copper wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is 2.7 ± 0.3 g.

Sinking time. Not more than 10 s. Weigh the basket to the nearest centigram (m_1). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram (m_2). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

Water-holding capacity. Not less than 23.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker (m_3) and weigh to the nearest centigram (m_4). Calculate the water-holding capacity per gram of absorbent cotton using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

Ether-soluble substances. Not more than 0.50 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

Extractable colouring matter. In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 ml of extract is obtained. The liquid obtained is not more intensely coloured (2.2.2, *Method II*) than reference solution Y_5 , GY_6 or a reference solution prepared as follows: to 3.0 ml of blue primary solution add 7.0 ml of hydrochloric acid (10 g/l HCl). Dilute 0.5 ml of this solution to 10.0 ml with hydrochloric acid (10 g/l HCl).

Surface-active substances. Introduce the 10 ml portion of solution S reserved before filtration into a 25 ml graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulphuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present must not cover the entire surface of the liquid.

Water-soluble substances. Not more than 0.50 per cent. Boil 5.000 g in 500 ml of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate 400 ml of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

Loss on drying (2.2.32). Not more than 8.0 per cent, determined on 5.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.40 per cent. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulphuric acid R*, then heat and incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.

STORAGE

Store in a dust-proof package in a dry place.

01/2005:1305

COTTONSEED OIL, HYDROGENATED

Gossypii oleum hydrogenatum

DEFINITION

Hydrogenated cottonseed oil is the product obtained by refining and hydrogenation of oil obtained from seeds of cultivated plants of various varieties of *Gossypium hirsutum* L. or of other species of *Gossypium*. The product consists mainly of triglycerides of palmitic and stearic acids.

CHARACTERS

A white mass or powder which melts to a clear, pale yellow liquid when heated, practically insoluble in water, freely soluble in methylene chloride and in toluene, very slightly soluble in alcohol.

IDENTIFICATION

- It complies with the test for melting point (see Tests).
- It complies with the test for foreign fatty oils (see Tests).

TESTS

Melting point (2.2.14): 57 °C to 70 °C.

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g. Dissolve the substance to be examined in 50 ml of a hot mixture of equal volumes of *alcohol R* and *toluene R*, previously neutralised with 0.1 M *potassium hydroxide* using 0.5 ml of *phenolphthalein solution RI* as indicator. Titrate the solution immediately while still hot.

Peroxide value (2.5.5). Not more than 5.0.

Unsaponifiable matter (2.5.7). Not more than 1.0 per cent, determined on 5.0 g.

Alkaline impurities. Dissolve by gentle heating 2.0 g of the substance to be examined in a mixture of 1.5 ml of *alcohol R* and 3 ml of *toluene R*. Add 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour to yellow.

Composition of fatty acids (2.4.22, Method A).

The chromatographic procedure may be carried out using:

- a fused-silica capillary column 25 m long and 0.25 mm in internal diameter coated on the inner wall with *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 0.65 ml/min,
- a flame-ionisation detector,
- a split injector (1:100),

maintaining the temperature of the column at 180 °C for 35 min and that of the injection port and the detector at 250 °C.

The fatty acid fraction of the oil has the following composition:

- *saturated fatty acids of chain length less than C₁₄*: not more than 0.2 per cent,
- *myristic acid*: not more than 1.0 per cent,
- *palmitic acid*: 19.0 per cent to 26.0 per cent,
- *stearic acid*: 68.0 per cent to 80.0 per cent,
- *oleic acid and isomers* (C_{18:1} equivalent chain length on *poly(cyanopropyl)siloxane* 18.5 to 18.8): not more than 4.0 per cent,
- *linoleic acid and isomers* (C_{18:2} equivalent chain length on *poly(cyanopropyl)siloxane* 19.4 to 19.8): not more than 1.0 per cent,
- *arachidic acid*: not more than 1.0 per cent,
- *behenic acid*: not more than 1.0 per cent,
- *lignoceric acid*: not more than 0.5 per cent.

Nickel. Not more than 1 ppm of Ni, determined by atomic absorption spectrometry (2.2.23, Method II).

Test solution. Introduce 5.0 g of the substance to be examined into a platinum or silica crucible tared after ignition. Cautiously heat and introduce into the substance a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600 °C. Continue the incineration until white ash is obtained. After cooling, take up the residue with two quantities, each of 2 ml, of *dilute hydrochloric acid R* and transfer into a 25 ml graduated flask. Add 0.3 ml of *nitric acid R* and dilute to 25.0 ml with *distilled water R*.

Reference solutions. Prepare three reference solutions by adding 1.0 ml, 2.0 ml and 4.0 ml of *nickel standard solution* (0.2 ppm Ni) *R* to 2.0 ml portions of the test solution, diluting to 10.0 ml with *distilled water R*.

Measure the absorbance at 232 nm using a nickel hollow-cathode lamp as a source of radiation, a graphite furnace as an atomic generator and *argon R* as the carrier gas.

STORAGE

Store protected from light.

01/2005:1306 DEFINITION

COUCH GRASS RHIZOME**Graminis rhizoma****DEFINITION**

Whole or cut, washed and dried rhizome of *Agropyron repens* (L.) Beauv. (*Elymus repens* (L.) Gould); the adventitious roots are removed.

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The shiny yellowish, light brown or yellowish-brown pieces of the rhizome are 2 mm to 3 mm thick and longitudinally furrowed. At the nodes are the remains of very thin, more or less branched roots and whitish or brownish scale-like leaves; the internodes, up to 6 cm long, are furrowed and hollow inside. The transverse section of the nodes shows a yellowish medulla.
- B. Reduce to a powder (355). The powder is whitish-yellow. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis covered with a thick cuticle and composed of rectangular and elongated thick-walled cells with pitted slightly wavy walls which alternate with small rounded to almost square cells; U-shaped thickened endodermic cells; numerous fragments of moderately thickened fibres and groups of vessels with slit-shaped pits or with spiral and annular thickening.

TESTS

Cynodon dactylon, Imperata cylindrica. Examine under a microscope using *iodine solution R1*. No blue starch grains are visible.

Foreign matter (2.8.2): maximum 15 per cent of greyish-black pieces of rhizome in the cut drug.

Water-soluble extractive: minimum 25 per cent.

To 5.0 g of the powdered drug (355) add 200 ml of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 ml with *water R* and filter. Evaporate 20.0 ml of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.125 g.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 5.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 1.5 per cent.

01/2005:1628

CRESOL, CRUDE**Cresolum crudum**C₇H₈OM_r 108.1

Mixture of 2-, 3- and 4-methylphenol.

CHARACTERS

Appearance: colourless or pale brown liquid.

Solubility: sparingly soluble in water, miscible with alcohol and with methylene chloride.

IDENTIFICATION

- A. To 0.5 ml add 300 ml of *water R*, mix and filter. To 10 ml of the filtrate add 1 ml of *ferric chloride solution R1*. A blue colour is produced.
- B. To 10 ml of the filtrate obtained in identification test A, add 1 ml of *bromine water R*. A pale yellow flocculent precipitate is produced.
- C. It complies with the test for relative density (see Tests).

TESTS

Solution S. To 2.5 g of the substance to be examined add 50 ml of *water R*, shake for 1 min and filter through a moistened filter.

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.3 ml of 0.01 M *hydrochloric acid*. The solution is red.

Relative density (2.2.5): 1.029 to 1.044.

Distillation range (2.2.11): a maximum of 2.0 per cent V/V distils below 188 °C and a minimum of 80 per cent V/V distils between 195 °C and 205 °C.

Sulphur compounds. Place 20 ml in a small conical flask. Over the mouth of the flask fix a piece of filter paper moistened with *lead acetate solution R*. Heat on a water-bath for 5 min. Not more than a light yellow colour is produced on the filter paper.

Residue on evaporation: maximum 0.1 per cent.

Evaporate 2.0 g to dryness on a water-bath and dry at 100-105 °C for 1 h. The residue weighs not more than 2 mg.

STORAGE

Protected from light.

01/2005:0985

CROSCARMELLOSE SODIUM**Carmellosum natricum conexum****DEFINITION**

Croscarmellose sodium (cross-linked sodium carboxymethylcellulose) is the sodium salt of a cross-linked, partly *O*-carboxymethylated cellulose.

CHARACTERS

A white or greyish-white powder, practically insoluble in acetone, in ethanol and in toluene.

IDENTIFICATION

- A. Shake 1 g with 100 ml of a solution containing 4 ppm of *methylene blue R* and allow to settle. The substance to be examined absorbs the methylene blue and settles as a blue, fibrous mass.
- B. Shake 1 g with 50 ml of *water R*. Transfer 1 ml of the mixture to a test-tube, add 1 ml of *water R* and 0.05 ml of a freshly prepared 40 g/l solution of *α-naphthol R* in

methanol R. Incline the test-tube and add carefully 2 ml of *sulphuric acid R* down the side so that it forms a lower layer. A reddish-violet colour develops at the interface.

C. It gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Shake 1 g with 100 ml of *carbon dioxide-free water R* for 5 min. The pH of the suspension is 5.0 to 7.0.

Degree of substitution. Place 1.000 g in a 500 ml conical flask, add 300 ml of a 100 g/l solution of *sodium chloride R*, 25.0 ml of 0.1 M *sodium hydroxide*, stopper the flask and allow to stand for 5 min, shaking occasionally. Add 0.05 ml of *m-cresol purple solution R* and about 15 ml of 0.1 M *hydrochloric acid* from a burette. Insert the stopper and shake. If the solution is violet, add 0.1 M *hydrochloric acid* in 1 ml portions until the solution becomes yellow, shaking after each addition. Titrate with 0.1 M *sodium hydroxide* until the colour turns to violet.

Calculate the number of milliequivalents (*M*) of base required for the neutralisation equivalent to 1 g of dried substance.

Calculate the degree of acid carboxymethyl substitution (*A*) from the expression:

$$\frac{1150M}{(7102 - 412M - 80C)}$$

C = sulphated ash as a percentage.

Calculate the degree of sodium carboxymethyl substitution (*S*) from the expression:

$$\frac{(162 + 58A)C}{(7102 - 80C)}$$

The degree of substitution is the sum of *A* + *S* and it is between 0.60 and 0.85, calculated with reference to the dried substance.

Sodium chloride and sodium glycollate. The sum of the percentage contents of sodium chloride and sodium glycollate is not more than 0.5 per cent, calculated with reference to the dried substance.

Sodium chloride. Place 5.00 g in a 250 ml conical flask, add 50 ml of *water R* and 5 ml of *strong hydrogen peroxide solution R* and heat on a water-bath for 20 min, stirring occasionally to ensure total hydration. Cool, add 100 ml of *water R* and 10 ml of *nitric acid R*. Titrate with 0.05 M *silver nitrate* determining the end-point potentiometrically (2.2.20) using a silver indicator electrode and a double-junction reference electrode containing a 100 g/l solution of *potassium nitrate R* in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly.

1 ml of 0.05 M *silver nitrate* is equivalent to 2.922 mg of NaCl.

Sodium glycollate. Place a quantity of the substance to be examined equivalent to 0.500 g of the dried substance in a 100 ml beaker. Add 5 ml of *glacial acetic acid R* and 5 ml of *water R* and stir to ensure total hydration (about 15 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a fast filter paper impregnated with *acetone R* into a volumetric flask, rinse the beaker and filter with 30 ml of *acetone R* and dilute the filtrate to 100.0 ml with the same solvent. Allow to stand for 24 h without shaking. Use the clear supernatant to prepare the test solution.

Prepare the reference solutions as follows: in a 100 ml volumetric flask, dissolve 0.100 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*,

in *water R* and dilute to 100.0 ml with the same solvent. Use the solution within 30 days. Transfer 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of the solution to separate volumetric flasks; dilute the contents of each flask to 5.0 ml with *water R*, add 5 ml of *glacial acetic acid R*, dilute to 100.0 ml with *acetone R* and mix.

Transfer 2.0 ml of the test solution and 2.0 ml of each of the reference solutions to separate 25 ml volumetric flasks. Heat the uncovered flasks for 20 min on a water-bath to eliminate acetone. Allow to cool and add 5.0 ml of 2,7-dihydroxynaphthalene solution *R* to each flask. Mix, add a further 15.0 ml of 2,7-dihydroxynaphthalene solution *R* and mix again. Close the flasks with aluminium foil and heat on a water-bath for 20 min. Cool and dilute to 25.0 ml with *sulphuric acid R*.

Measure the absorbance (2.2.25) of each solution at 540 nm. Prepare a blank using 2.0 ml of a solution containing 5 per cent V/V each of *glacial acetic acid R* and *water R* in *acetone R*. Prepare a standard curve using the absorbances obtained with the reference solutions. From the standard curve and the absorbance of the test solution, determine the mass *a*, in milligrams, of glycollic acid in the substance to be examined, and calculate the content of sodium glycollate from the expression:

$$\frac{10 \times 1.29 \times a}{(100 - b)m}$$

1.29 = the factor converting glycollic acid to sodium glycollate,

b = loss on drying as a percentage,

m = mass of the substance to be examined, in grams.

Water-soluble substances. Not more than 10.0 per cent. Disperse 10.00 g in 800.0 ml of *water R* and stir for 1 min every 10 min during the first 30 min. Allow to stand for 1 h and centrifuge, if necessary. Decant 200.0 ml of the supernatant liquid onto a fast filter paper in a vacuum filtration funnel, apply vacuum and collect 150.0 ml of the filtrate. Evaporate to dryness and dry the residue at 100 °C to 105 °C for 4 h.

Heavy metals (2.4.8). To the residue obtained in the determination of the sulphated ash add 1 ml of *hydrochloric acid R* and evaporate on a water-bath. Take up the residue in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 6 h.

Sulphated ash (2.4.14): 14.0 per cent to 28.0 per cent, determined on 2.000 g, using a mixture of equal volumes of *sulphuric acid R* and *water R*, and calculated with reference to the dried substance.

Settling volume. Place 75 ml of *water R* in a 100 ml graduated cylinder and add 1.5 g of the substance to be examined in 0.5 g portions, shaking vigorously after each addition. Dilute to 100.0 ml with *water R* and shake again until the substance is homogeneously distributed. Allow to stand for 4 h. The settling volume is between 10.0 ml and 30.0 ml.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ bacteria and 10² fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:0892

CROSOVIDONE

Crosopovidonum

 $(C_6H_9NO)_n$ M_r (111.1)_n

DEFINITION

Crosopovidone is a cross-linked homopolymer of 1-ethenylpyrrolidin-2-one. It is available in different degrees of powder fineness (type A and type B).

Content: 11.0 per cent to 12.8 per cent of nitrogen (N; A_r 14.01) (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder or flakes, hygroscopic.

Solubility: practically insoluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of crosopovidone.*

B. Suspend 1 g in 10 ml of *water R*, add 0.1 ml of 0.05 M iodine and shake for 30 s. Add 1 ml of *starch solution R* and shake. No blue colour develops within 30 s.

C. To 10 ml of *water R*, add 0.1 g and shake. A suspension is formed and no clear solution is obtained within 15 min.

D. Weigh a suitable quantity of the substance to be examined (for example 10 mg to 100 mg) and suspend it in 10.0 ml of *water R*, adding a wetting agent. Observe under a microscope at a suitable magnification using a calibrated ocular micrometer. If the majority of particles are in the range 50 µm to 300 µm, the product is classified as type A. If almost all the particles are below 50 µm, the product is classified as type B.

TESTS

Peroxides. Type A: maximum 400 ppm expressed as H_2O_2 ; type B: maximum 1000 ppm expressed as H_2O_2 .

Suspend 2.0 g in 50 ml of *water R*. To 25 ml of this suspension add 2 ml of *titanium trichloride-sulphuric acid reagent R*. Allow to stand for 30 min and filter. The absorbance (2.2.25) of the filtrate, measured at 405 nm using a mixture of 25 ml of a filtered 40 g/l suspension of the substance to be examined and 2 ml of a 13 per cent V/V solution of *sulphuric acid R* as the compensation liquid has a maximum of 0.35.

For type B use 10 ml of the suspension diluted to 25 ml with *water R* for the test.

Water-soluble substances: maximum 1.0 per cent.

Transfer 25.0 g to a 400 ml beaker, add 200 ml of *water R* and stir for 1 h using a magnetic stirrer. Transfer the suspension to a 250.0 ml volumetric flask, rinsing with *water R*, and dilute to volume with the same solvent. Allow the bulk of the solids to settle. Filter about 100 ml of the almost clear supernatant liquid through a 0.45 µm membrane filter, protected by superimposing a 3 µm membrane filter. While filtering, stir the liquid above the filter manually or by means

of a mechanical stirrer, taking care not to damage the filter. Transfer 50.0 ml of the clear filtrate to a tared 100 ml beaker, evaporate to dryness and dry at 105–110 °C for 3 h. The residue weighs a maximum of 50 mg.

Impurity A. Liquid chromatography (2.2.29).

Test solution. Suspend 1.250 g in 50.0 ml of *methanol R* and shake for 60 min. Leave the bulk to settle and filter through a 0.2 µm filter.

Reference solution (a). Dissolve 50 mg of 1-vinylpyrrolidin-2-one *R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of 1-vinylpyrrolidin-2-one *R* and 0.50 g of *vinyl acetate R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Precolumn:

- **size:** $l = 0.025$ m, $\varnothing = 4$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm),
- **temperature:** 40 °C.

Mobile phase: acetonitrile *R*, water *R* (10:90 V/V).

Flow rate: adjusted so that the retention time of the peak corresponding to impurity A is about 10 min.

Detection: spectrophotometer at 235 nm.

Injection: 50 µl. After each injection of the test solution, wash the precolumn by passing the mobile phase backward, at the same flow rate as applied in the test, for 30 min.

System suitability:

- **resolution:** minimum of 2.0 between the peaks corresponding to impurity A and to vinyl acetate in the chromatogram obtained with reference solution (b),
- **repeatability:** maximum relative standard deviation of 2.0 per cent after 5 injections of reference solution (a).

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Place 100.0 mg of the substance to be examined (m mg) in a combustion flask, add 5 g of a mixture of 1 g of *copper sulphate R*, 1 g of *titanium dioxide R* and 33 g of *dipotassium sulphate R*, and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of *water R*. Add 7 ml of *sulphuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulphuric acid. Heat gradually at first, then increase the temperature until there is vigorous

boiling with condensation of sulphuric acid in the neck of the flask; precautions are to be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 45 min. Cool, dissolve the solid material by cautiously adding to the mixture 20 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution R* through the funnel, rinse the funnel cautiously with 10 ml of *water R* and distil immediately by passing steam through the mixture. Collect 80-100 ml of distillate in a mixture of 30 ml of a 40 g/l solution of *boric acid R* and 0.05 ml of *bromocresol green-methyl red solution R* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation lower the receiver so that the tip of the condenser is above the surface of the acid solution and rinse the end part of the condenser with a small quantity of *water R*. Titrate the distillate with 0.025 *M* sulphuric acid until the colour of the solution changes from green through pale greyish-blue to pale greyish-red-purple (n_1 ml of 0.025 *M* sulphuric acid). Repeat the test using about 100 mg of *glucose R* in place of the substance to be examined (n_2 ml of 0.025 *M* sulphuric acid).

$$\text{Percentage content of nitrogen} = \frac{0.7004(n_1 - n_2)}{m} \times 100$$

STORAGE

In an airtight container.

LABELLING

The label states the type (type A or type B).

IMPURITIES

A. 1-ethenylpyrrolidin-2-one (1-vinylpyrrolidin-2-one).

01/2005:1194

CROTAMITON

Crotamitonum

$C_{13}H_{17}NO$

M_r 203.3

DEFINITION

Crotamiton contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of *N*-ethyl-*N*-(2-methylphenyl)but-2-enamide, calculated as the sum of the *E*- and *Z*-isomers, and not more than 15.0 per cent of the *Z*-isomer.

CHARACTERS

A colourless or pale yellow, oily liquid, slightly soluble in water, miscible with alcohol. At low temperatures it may partly or completely solidify.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Dissolve 25.0 mg in *cyclohexane R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *cyclohexane R*. Examined between 220 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 242 nm. The specific absorbance at the maximum is 300 to 330.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *crotamiton CRS*.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 25 mg of the substance to be examined in *ethanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 25 mg of *crotamiton CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 μ l of each solution. Develop over a path of 15 cm using the mixture prepared as follows: shake 98 volumes of *methylene chloride R* with 2 volumes of *concentrated ammonia R*, dry over *anhydrous sodium sulphate R*, filter and mix 97 volumes of the filtrate with 3 volumes of *2-propanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- To 10 ml of a saturated solution add a few drops of a 3 g/l solution of *potassium permanganate R*. A brown colour is produced and a brown precipitate is formed on standing.

TESTS

Relative density (2.2.5): 1.006 to 1.011.

Refractive index (2.2.6): 1.540 to 1.542.

Free amines. Dissolve 5.00 g in 16 ml of *methylene chloride R* and add 4.0 ml of *glacial acetic acid R*. Add 0.1 ml of *metanil yellow solution R* and 1.0 ml of 0.02 *M* *perchloric acid*. The solution is red-violet (500 ppm as ethylaminotoluene).

Chlorides. Boil 5.0 g under a reflux condenser for 1 h with 25 ml of *alcohol R* and 5 ml of a 200 g/l solution of *sodium hydroxide R*. Cool, add 5 ml of *water R* and shake with 25 ml of *ether R*. Dilute the lower layer to 20 ml with *water R*; add 5 ml of *nitric acid R*, dilute to 50 ml with *water R* and add 1 ml of a freshly prepared 50 g/l solution of *silver nitrate R*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of a freshly prepared 50 g/l solution of *silver nitrate R* and a solution prepared by diluting 5 ml of a 200 g/l solution of *sodium hydroxide R* to 20 ml with *water R* and adding 1.5 ml of 0.01 *M* *hydrochloric acid*, 5 ml of *nitric acid R* and sufficient *water R* to produce 50 ml (100 ppm).

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 μ l each of test solution (a), reference solution (b) and reference solution (c). Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a): the area of any peak corresponding to crotamiton impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (3 per cent); the sum of the areas of any peaks, apart from the

principal peak, the peak corresponding to the *Z*-isomer and any peak corresponding to crotamiton impurity A, is not greater than the sum of the areas of the peaks corresponding to the *Z*- and *E*-isomers in the chromatogram obtained with reference solution (c) (1 per cent). Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (c).

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *crotamiton CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 15.0 mg of *crotamiton impurity A CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve 15 mg of *crotamiton impurity A CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 1 ml of the solution to 10 ml with test solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 8 volumes of *tetrahydrofuran R* and 92 volumes of *cyclohexane R*,
- as detector a spectrophotometer set at 242 nm.

Inject 20 µl of reference solution (b) and 20 µl of reference solution (d). When the chromatograms are recorded in the prescribed conditions, the retention times relative to the principal peak (*E*-isomer) are: *Z*-isomer about 0.5 and crotamiton impurity A about 0.8. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 70 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to impurity A and the *E*-isomer is at least 4.5.

Inject alternately test solution (b) and reference solution (a). Calculate the percentage content of $C_{13}H_{17}NO$ from the sum of the areas of the peaks due to the *Z*- and *E*-isomers in the chromatograms obtained. Calculate the content of the *Z*-isomer, as a percentage of the total content of the *E*- and *Z*-isomers, from the chromatogram obtained with test solution (b).

STORAGE

Protected from light.

IMPURITIES

A. *N*-ethyl-*N*-(2-methylphenyl)but-3-enamide.

CYANOCOBALAMIN

Cyanocobalaminum

$C_{63}H_{88}CoN_{14}O_{14}P$

M_r 1355

DEFINITION

Cyanocobalamin contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of α -(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide, calculated with reference to the dried substance.

CHARACTERS

A dark-red, crystalline powder or dark-red crystals, sparingly soluble in water and in alcohol, practically insoluble in acetone. The anhydrous substance is very hygroscopic.

IDENTIFICATION

- A. Dissolve 2.5 mg in *water R* and dilute to 100.0 ml with the same solvent. Examined between 260 nm and 610 nm (2.2.25), the solution shows 3 absorption maxima, at 278 nm, 361 nm and at 547 nm to 559 nm. The ratio of the absorbance at the maximum at 361 nm to that at the maximum at 547 nm to 559 nm is 3.15 to 3.45. The ratio of the absorbance at the maximum at 361 nm to that at the maximum at 278 nm is 1.70 to 1.90.

- B. Carry out the test protected from light.

Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 2 mg of the substance to be examined in 1 ml of a mixture of equal volumes of *alcohol R* and *water R*.

Reference solution. Dissolve 2 mg of *cyanocobalamin CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R*.

Apply to the plate 10 µl of each solution. Develop in a non-saturated tank over a path of 12 cm using a mixture of 9 volumes of *dilute ammonia R1*, 30 volumes of *methanol R* and 45 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the same mixture of solvents. Use within 1 h.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Use within 1 h.

Reference solution (b). Dilute 5.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase. Use within 1 h.

Reference solution (c). Dissolve 25 mg of the substance to be examined in 10 ml of *water R*, warming if necessary. Allow to cool and add 5 ml of a 1.0 g/l solution of *chloramine R* and 0.5 ml of 0.05 M *hydrochloric acid*. Dilute to 25 ml with *water R*. Shake and allow to stand for 5 min. Dilute 1 ml of this solution to 10 ml with the mobile phase and inject immediately.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as the mobile phase at a flow rate of 0.8 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* adjusted to pH 3.5 using *phosphoric acid R* and use within 2 days,
- a spectrophotometer set at 361 nm as detector,
- a loop injector.

Inject separately 20 µl of each solution and continue the chromatography for 3 times the retention time of cyanocobalamin. In the chromatogram obtained with the test solution, the sum of the areas of any peaks apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (3 per cent). Disregard any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 principal peaks, the resolution between these peaks is not less than 2.5 and the chromatogram obtained with reference solution (b) shows one principal peak with a signal-to-noise ratio of not less than 5.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 20.00 mg by drying *in vacuo* at 100–105 °C for 2 h.

ASSAY

Dissolve 25.00 mg in *water R* and dilute to 1000.0 ml with the same solvent. Measure the absorbance (2.2.25) of the solution at the maximum at 361 nm. Calculate the content of $C_{63}H_{88}CoN_{14}O_{14}P$, taking the specific absorbance to be 207.

STORAGE

Store in an airtight container, protected from light.

01/2005:1092

CYCLIZINE HYDROCHLORIDE

Cyclizini hydrochloridum

$C_{18}H_{23}ClN_2$

M_r 302.8

DEFINITION

Cyclizine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 1-(diphenylmethyl)-4-methylpiperazine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 20.0 mg in a 5 g/l solution of *sulphuric acid R* and dilute to 100.0 ml with the same acid solution (solution A). Examined between 240 nm and 350 nm (2.2.25), solution A shows two absorption maxima, at 258 nm and 262 nm. The ratio of the absorbance measured at the maximum at 262 nm to that measured at the maximum at 258 nm is 1.0 to 1.1. Dilute 10.0 ml of solution A to 100.0 ml with a 5 g/l solution of *sulphuric acid R* (solution B). Examined between 210 nm and 240 nm, solution B shows an absorption maximum at 225 nm. The specific absorbance at the maximum is 370 to 410. Verify the resolution of the apparatus (2.2.25); the test is not valid unless the ratio of the absorbances is at least 1.7.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cyclizine hydrochloride CRS*. Examine the substances prepared as discs using *potassium chloride R*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve 0.5 g in 10 ml of *alcohol (60 per cent V/V) R* using heat, if necessary. Cool in iced water. Add 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R*. Filter, wash the precipitate with *water R* and dry it at 60 °C at a pressure not exceeding 0.7 kPa for 2 h. The melting point (2.2.14) is 105 °C to 108 °C.
- E. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in a mixture of 40 volumes of *alcohol R* and 60 volumes of *carbon dioxide-free water R* and dilute to 25 ml with the same mixture of solvents. The pH of the solution is 4.5 to 5.5.

01/2005:1093

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*. Prepare the solutions immediately before use.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 5 ml of test solution (a) to 100 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *cyclizine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *methylpiperazine R* in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution (c). Dilute 1 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *cyclizine hydrochloride CRS* and 10 mg of *hydroxyzine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *concentrated ammonia R*, 13 volumes of *methanol R* and 85 volumes of *methylene chloride R*. Allow the plate to dry in air for 30 min. Expose the plate to iodine vapour for 10 min. In the chromatogram obtained with test solution (a): any spot corresponding to 1-methylpiperazine is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent); any spot, apart from the principal spot and any spot corresponding to 1-methylpiperazine, is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 130 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 15 ml of *anhydrous formic acid R* and add 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 15.14 mg of $C_{17}H_{26}ClNO_3$.

STORAGE

Store protected from light.

IMPURITIES

A. 1-methylpiperazine.

CYCLOPENTOLATE HYDROCHLORIDE

Cyclopentolati hydrochloridum

$C_{17}H_{26}ClNO_3$

M_r 327.9

DEFINITION

Cyclopentolate hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-(dimethylamino)ethyl (R,S)-2-(1-hydroxycyclopentyl)-2-phenylacetate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Melting point (2.2.14): 135 °C to 141 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cyclopentolate hydrochloride CRS*. Examine the substances as discs prepared using *potassium chloride R*. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with reference solution (b).
- It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 4.5 to 5.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *alcohol R*.

Reference solution (a). Dilute 1 ml of test solution (a) to 200 ml with *alcohol R*.

Reference solution (b). Dissolve 10 mg of *cyclopentolate hydrochloride CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *water R*, 30 volumes of *butyl acetate R* and 50 volumes of *2-propanol R*. Allow

the plate to dry in air. Spray with *an alcoholic solution of sulphuric acid R* and heat the plate at 120 °C for 30 min. Examine in ultraviolet light at 365 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 1.0 ml of 0.1 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 32.79 mg of $C_{7}H_{15}Cl_2N_2O_2P$.

01/2005:0711

CYCLOPHOSPHAMIDE

Cyclophosphamidum

 $C_7H_{15}Cl_2N_2O_2P \cdot H_2O$
 M_r 279.1

DEFINITION

Cyclophosphamide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*RS*)-*N,N*-bis(2-chloroethyl)tetrahydro-2*H*-1,3,2-oxazaphosphorin-2-amine 2-oxide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Determine the melting point (2.2.14) of the substance to be examined. Mix equal parts of the substance to be examined and *cyclophosphamide CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 51 °C) is not greater than 2 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cyclophosphamide CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- Dissolve 0.1 g in 10 ml of *water R* and add 5 ml of *silver nitrate solution R1*; the solution remains clear. Boil, a white precipitate is formed which dissolves in *concentrated ammonia R* and is reprecipitated on the addition of *dilute nitric acid R*.

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 6.0, determined immediately after preparation of the solution.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *alcohol R*.

Reference solution (a). Dissolve 10 mg of *cyclophosphamide CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 0.1 ml of test solution (a) to 10 ml with *alcohol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *anhydrous formic acid R*, 4 volumes of *acetone R*, 12 volumes of *water R* and 80 volumes of *methyl ethyl ketone R*. Dry the plate in a current of warm air and heat at 110 °C for 10 min. At the bottom of a chromatography tank, place an evaporating dish containing a 50 g/l solution of *potassium permanganate R* and add an equal volume of *hydrochloric acid R*. Place the plate whilst still hot in the tank and close the tank. Leave the plate in contact with the chlorine gas for 2 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution R*. Avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* and allow to stand for 5 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any spot remaining at the starting-point.

Chlorides (2.4.4). Dissolve 0.15 g in *water R* and dilute to 15 ml with the same solvent. The freshly prepared solution complies with the limit test for chlorides (330 ppm).

Phosphates (2.4.11). Dissolve 0.10 g in *water R* and dilute to 100 ml with the same solvent. The solution complies with the limit test for phosphates (100 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): 6.0 per cent to 7.0 per cent, determined on 0.300 g by the semi-micro determination of water.

ASSAY

Dissolve 0.100 g in 50 ml of a 1 g/l solution of *sodium hydroxide R* in *ethylene glycol R* and boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 25 ml of *water R*. Add 75 ml of *2-propanol R*, 15 ml

of *dilute nitric acid R*, 10.0 ml of *0.1 M silver nitrate* and 2.0 ml of *ferric ammonium sulfate solution R2* and titrate with *0.1 M ammonium thiocyanate*.

1 ml of *0.1 M silver nitrate* is equivalent to 13.05 mg of $C_{21}H_{22}ClN$.

01/2005:0817

CYPROHEPTADINE HYDROCHLORIDE

Cyproheptadini hydrochloridum

 $C_{21}H_{22}ClN \cdot 1\frac{1}{2} \text{H}_2\text{O}$
 M_r 350.9

DEFINITION

Cyproheptadine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-(5*H*-dibenzo[*a,d*]cyclohepten-5-ylidene)-1-methylpiperidine hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellow, crystalline powder, slightly soluble in water, freely soluble in methanol, sparingly soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Examined between 230 nm and 320 nm (2.2.25), the solution shows an absorption maximum at 286 nm. The specific absorbance at the maximum is 335 to 365, calculated with reference to the anhydrous substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cyproheptadine hydrochloride CRS*. Examine the substances as mulls in *liquid paraffin R*.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 25 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *cyproheptadine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *imipramine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent. Dilute 1 ml to 2 ml with reference solution (a).

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *diethylamine R*, 20 volumes of *ether R* and 75 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

D. A saturated solution gives reaction (b) of chlorides (2.3.1).

TESTS

Acidity. Dissolve 0.10 g in *water R* and dilute to 25 ml with the same solvent. Add 0.1 ml of *methyl red solution R*. Not more than 0.15 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *dibenzocycloheptene CRS* (5*H*-dibenzo[*a,d*]cycloheptene) in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 50 ml with the same mixture of solvents. Dilute 1 ml to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*. Dilute 1 ml to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *alcoholic solution of sulphuric acid R*. Heat at 110 °C for 30 min and examine in ultraviolet light at 365 nm while hot. In the chromatogram obtained with the test solution: any spot corresponding to dibenzocycloheptene is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent); any spot apart from the principal spot and any spot corresponding to dibenzocycloheptene is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Water (2.5.12): 7.0 per cent to 9.0 per cent, determined on 0.200 g.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 32.39 mg of $C_{21}H_{22}ClN$.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H₂: dibenzo[*a,d*]cycloheptene,
 B. R = O: 5*H*-dibenzo[*a,d*]cyclohepten-5-one
 (dibenzosuberone).

01/2005:1094

CYPROTERONE ACETATE

Cyproteroni acetat

C₂₄H₂₉ClO₄M_r 416.9

DEFINITION

Cyproterone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 6-chloro-3,20-dioxo-1β,2β-dihydro-3'*H*-cyclopropa[1,2]pregna-1,4,6-trien-17-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in acetone, soluble in methanol, sparingly soluble in ethanol.

It melts at about 210 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C, D, E.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cyproterone acetate CRS*.
 B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 20 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *cyproterone acetate CRS* in *methylene chloride R* and dilute to 5 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *ethyl acetate R*. Allow the plate to dry in air. Repeat the development. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- C. To about 1 mg add 2 ml of *sulphuric acid R* and heat on a water-bath for 2 min. A red colour develops. Cool. Add the solution cautiously to 4 ml of *water R* and shake. The solution becomes violet.
 D. Incinerate about 30 mg with 0.3 g of *anhydrous sodium carbonate R* over a naked flame for about 10 min. Cool and dissolve the residue in 5 ml of *dilute nitric acid R*. Filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).
 E. It gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.25 g in *acetone R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 152 to + 157, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 5 mg of *medroxyprogesterone acetate CRS* in *acetonitrile R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (a) and 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the peak corresponding to cyproterone acetate and the peak corresponding to medroxyprogesterone acetate is at least 3.0.

Inject 20 µl of the test solution. Continue the chromatography for twice the retention time of cyproterone acetate. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 80 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the maximum at 282 nm.

Calculate the content of C₂₄H₂₉ClO₄ taking the specific absorbance to be 414.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: 3,20-dioxo-1 β ,2 β -dihydro-3'*H*-cyclopropa[1,2]pregna-1,4,6-trien-17-yl acetate,
- B. R = OCH₃: 6-methoxy-3,20-dioxo-1 β ,2 β -dihydro-3'*H*-cyclopropa[1,2]pregna-1,4,6-trien-17-yl acetate.

01/2005:0895

CYSTEINE HYDROCHLORIDE MONOHYDRATE

Cysteinum hydrochloridum monohydricum

C₃H₈ClNO₂S·H₂O*M*_r 175.6

DEFINITION

Cysteine hydrochloride monohydrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-2-amino-3-sulfanylpropanoic acid hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cysteine hydrochloride monohydrate CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour, and size to the principal spot in the chromatogram obtained with reference solution (b).
- Dissolve about 5 mg in 1 ml of *dilute sodium hydroxide solution R*. Add 1 ml of a 30 g/l solution of *sodium nitroprusside R*. An intense violet colour develops which becomes brownish-red and then orange. Add 1 ml of *hydrochloric acid R*. The solution becomes green.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Dilute 10 ml of solution S to 20 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 5.5 to + 7.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent. To 5 ml of the solution add 5 ml of a 40 g/l solution of *N-ethylmaleimide R* in *alcohol R*. Allow to stand for 5 min.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 20 mg of *cysteine hydrochloride monohydrate CRS* in *water R* and dilute to 10 ml with the same solvent. Add 10 ml of a 40 g/l solution of *N-ethylmaleimide R* in *alcohol R*. Allow to stand for 5 min.

Reference solution (b). Dilute 2 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (d). Dissolve 10 mg of *tyrosine CRS* in 10 ml of reference solution (a) and dilute to 25 ml with *water R*.

Apply separately to the plate 5 μ l of each test solution and reference solutions (b), (c), and (d). Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Dry the plate at 80 °C for 30 min. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows 2 clearly separated principal spots.

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 0.50 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R*. Adjust to pH 3 to 4 with *concentrated ammonia R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 8.0 per cent to 12.0 per cent, determined on 1.000 g by drying at a pressure not exceeding 0.7 kPa for 24 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In a ground-glass stoppered flask dissolve 0.300 g of the substance to be examined and 4 g of *potassium iodide R* in 20 ml of *water R*. Cool the solution in iced water and add 3 ml of *hydrochloric acid R1* and 25.0 ml of 0.05 *M iodine*. Stopper the flask and allow to stand in the dark for 20 min. Titrate with 0.1 *M sodium thiosulphate* using 3 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of 0.05 *M iodine* is equivalent to 15.76 mg of $C_6H_{12}N_2O_4S_2$.

STORAGE

Store protected from light.

01/2005:0998

CYSTINE

Cystinum

 $C_6H_{12}N_2O_4S_2$
 M_r 240.3

DEFINITION

Cystine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3,3'-disulfanedibis[(2*R*)-2-aminopropanoic acid], calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cystine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 0.1 g carefully add 1 ml of *strong hydrogen peroxide solution R* and 0.1 ml of *ferric chloride solution R1*. Allow to cool. Add 1 ml of *dilute hydrochloric acid R* and 5 ml of *water R*. Add 1 ml of *barium chloride solution R1*. Turbidity or a white precipitate develops within 3 min.

TESTS

Appearance of solution. Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.50 g in 1 *M hydrochloric acid* and dilute to 25.0 ml with the same acid. The specific optical rotation is -218 to -224, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 1 *M hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *cystine CRS* in 1 ml of 1 *M hydrochloric acid* and dilute to 50 ml with *water R*.

Reference solution (b). Dilute 2 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *cystine CRS* and 10 mg of *arginine hydrochloride CRS* in 1 ml of 1 *M hydrochloric acid* and dilute to 25 ml with *water R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R* and 70 volumes of 2-propanol *R*. Allow the plate to dry in air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dissolve 0.25 g in 5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution, without further addition of nitric acid, complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In a flask with a ground-glass stopper, dissolve 0.100 g in a mixture of 2 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R*. Add 10 ml of a 200 g/l solution of *potassium bromide R*, 50.0 ml of 0.0167 *M potassium bromate* and 15 ml of *dilute hydrochloric acid R*. Stopper the flask and cool in iced water. Allow to stand in the dark for 10 min. Add 1.5 g of *potassium iodide R*. After 1 min, titrate with 0.1 *M sodium thiosulphate*, using 2 ml of *starch solution R*, added towards the end-point, as indicator. Carry out a blank titration.

1 ml of 0.0167 *M potassium bromate* is equivalent to 2.403 mg of $C_6H_{12}N_2O_4S_2$.

STORAGE

Store protected from light.

01/2005:0760

CYTARABINE

Cytarabinum

 $C_9H_{13}N_3O_5$
 M_r 243.2

DEFINITION

Cytarabine contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of 4-amino-1- β -D-arabinofuranosylpyrimidin-2(1*H*)-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, very slightly soluble in alcohol and in methylene chloride.

It melts at about 215 °C.

IDENTIFICATION

- Dissolve 20.0 mg in 0.1 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of the solution to 100.0 ml with 0.1 *M* hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 281 nm. The specific absorbance at the maximum is 540 to 570.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cytarabine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 154 to + 160, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *cytarabine CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *water R*.

Reference solution (c). Dissolve 20 mg of *uridine R* and 20 mg of *uracil arabinoside CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 μ l of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *water R*, 20 volumes of *acetone R* and 65 volumes of *methyl ethyl ketone R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.250 g by drying over *diphosphorus pentoxide R* at 60 °C at a pressure of 0.2 kPa to 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 60 ml of *anhydrous acetic acid R*, warming if necessary. Titrate with 0.1 *M* perchloric acid determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* perchloric acid is equivalent to 24.32 mg of $C_9H_{13}N_3O_5$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- $R = OH$, $R' = H$: 1- β -D-arabinofuranosylpyrimidine-2,4(1*H*, 3*H*)-dione (uracil arabinoside),
- $R = H$, $R' = OH$: 1- β -D-ribofuranosylpyrimidine-2,4(1*H*, 3*H*)-dione (uridine).

01/2005:1195

DALTEPARIN SODIUM**Dalteparinum natricum****DEFINITION**

Dalteparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by nitrous acid depolymerisation of heparin from porcine intestinal mucosa. The majority of the components have a 2-*O*-sulpho- α -L-idopyranosuronic acid structure at the non-reducing end and a 6-*O*-sulpho-2,5-anhydro-D-mannitol structure at the reducing end of their chain.

Dalteparin sodium complies with the monograph on Low-molecular-mass heparins (0828) with the modifications and additional requirements below:

The mass-average molecular mass ranges between 5600 and 6400, with a characteristic value of about 6000.

The degree of sulphatation is 2.0 to 2.5 per disaccharide unit.

The potency is not less than 110 IU and not more than 210 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The anti-factor IIa activity is not less than 35 IU and not more than 100 IU/mg, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 1.9 and 3.2.

PRODUCTION

Dalteparin sodium is produced by a validated manufacturing and purification procedure under conditions designed to minimise the presence of N-NO groups.

The manufacturing procedure must have been shown to reduce any contamination by N-NO groups to approved limits using an appropriate, validated quantification method.

IDENTIFICATION

Carry out identification test C as described in the monograph on *Low-molecular-mass heparins (0828)*. The following requirements apply:

The mass-average molecular mass ranges between 5600 and 6400. The mass percentage of chains lower than 3000 is not more than 13.0 per cent. The mass percentage of chains higher than 8000 ranges between 15.0 per cent and 25.0 per cent.

TESTS

Appearance of solution. Dissolve 1 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Nitrite. Not more than 5 ppm. Examine by liquid chromatography (2.2.29). *Rinse all volumetric flasks at least three times with water R before the preparation of the solutions.*

Test solution. Dissolve 80.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent. Allow to stand for at least 30 min.

Reference solution (a). Dissolve 60.0 mg of *sodium nitrite R* in *water R* and dilute to 1000.0 ml with the same solvent.

For the preparation of reference solution (b), use a pipette previously rinsed with reference solution (a).

Reference solution (b). Dilute 1.00 ml of reference solution (a) to 50.0 ml with *water R*.

Before preparing reference solutions (c), (d) and (e), rinse all pipettes with reference solution (b).

Reference solution (c). Dilute 1.00 ml of reference solution (b) to 100.0 ml with *water R* (1 ppm nitrite).

Reference solution (d). Dilute 3.00 ml of reference solution (b) to 100.0 ml with *water R* (3 ppm nitrite).

Reference solution (e). Dilute 5.00 ml of reference solution (b) to 100.0 ml with *water R* (5 ppm nitrite).

The chromatographic procedure may be carried out using:

- a column 0.125 m long and 4.3 mm in internal diameter packed with a strong anion-exchange resin,
- as mobile phase at a flow rate of 1.0 ml/min a solution consisting of 13.61 g of *sodium acetate R* dissolved in *water R*, adjusted to pH 4.3 with *phosphoric acid R* and diluted to 1000 ml with *water R*,
- as detector an appropriate electrochemical device with the following characteristics and settings: a suitable working electrode, a detector potential of + 1.00 V versus Ag/AgCl reference electrode and a detector sensitivity of 0.1 μ A full scale.

Inject 100 μ l of reference solution (d). When the chromatograms are recorded in the prescribed conditions, the retention time for nitrite is 3.3 to 4.0 min. The test is not valid unless:

- the number of theoretical plates calculated for the nitrite peak is at least 7000 per metre per column (dalteparin sodium will block the binding sites of the stationary phase, which will cause shorter retention times and lower separation efficiency for the analyte; the initial performance of the column may be partially restored using a 58 g/l solution of *sodium chloride R* at a flow rate of 1.0 ml/min for 1 h; after regeneration the column is rinsed with 200 ml to 400 ml of *water R*),
- the symmetry factor for the nitrite peak is less than three,
- the relative standard deviation of the peak area for nitrite obtained from six injections is less than 3.0 per cent.

Inject 100 μ l each of reference solutions (c) and (e). The test is not valid unless:

- the correlation factor for a linear relationship between concentration and response for reference solutions (c), (d) and (e) is at least 0.995,
- the signal-to-noise ratio for reference solution (c) is not less than 5 (if the noise level is too high, electrode recalibration is recommended),
- a blank injection of *water R* does not give rise to spurious peaks.

Inject 100 μ l of the test solution. Calculate the content of nitrite from the peak areas in the chromatogram obtained with reference solutions (c), (d) and (e).

Boron. Not more than 1 ppm, determined by inductively coupled plasma atomic emission spectroscopy.

Boron is determined by measurement of the emission from an inductively coupled plasma (ICP) at a wavelength specific to boron. The emission line at 249.733 nm is used. Use an appropriate apparatus, whose settings have been optimised as directed by the manufacturer.

Test solution. Dissolve 0.2500 g of the substance to be examined in about 2 ml of *water for chromatography R*, add 100 µl of *nitric acid R* and dilute to 10.00 ml with the same solvent.

Reference solution (a). Prepare a 1 per cent V/V solution of *nitric acid R* in *water for chromatography R* (blank).

Reference solution (b). Prepare a 11.4 µg/ml solution of *boric acid R* in a 1 per cent V/V solution of *nitric acid R* in *water for chromatography R* (STD_{cal}).

Reference solution (c). Dissolve 0.2500 g of a reference dalteparin sodium with no detectable boron in about 2 ml of *water for chromatography R*, add 100 µl of *nitric acid R* and dilute to 10.00 ml with the same solvent (STD₀).

Reference solution (d). Dissolve 0.2500 g of a reference dalteparin sodium with no boron detected in about 2 ml of a 1 per cent V/V solution of *nitric acid R* in *water for chromatography R*, add 10 µl of a 5.7 mg/ml solution of *boric acid R* and dilute to 10.00 ml with the same solvent (STD₁). This solution contains 1 µg/ml of boron.

Calculate the content of boron in the substance to be examined, using the following correction factor:

$$f = \frac{(\text{STD}_1 - \text{STD}_0) \times 2}{(\text{STD}_{\text{cal}} - \text{blank})}$$

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

01/2005:0077

DAPSONE

Dapsonum

C₁₂H₁₂N₂O₂SM_r 248.3

DEFINITION

Dapsone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4,4'-sulphonyldianiline, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish-white, crystalline powder, very slightly soluble in water, freely soluble in acetone, sparingly soluble in alcohol. It dissolves freely in dilute mineral acids.

IDENTIFICATION

- A. Melting point (2.2.14): 175 °C to 181 °C.
- B. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 260 nm and 295 nm. The specific absorbances at these maxima are 700 to 760 and 1150 to 1250, respectively.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *dapsone CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 10 ml with *methanol R*.

Apply separately to the plate 1 µl of test solution (b), 1 µl of reference solution (a), 10 µl of test solution (a), 10 µl of reference solution (b) and 10 µl of reference solution (c). Develop in an unsaturated tank over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 6 volumes of *methanol R*, 20 volumes of *ethyl acetate R* and 20 volumes of *heptane R*. Allow the plate to dry in air. Spray the plate with a 1 g/l solution of *4-dimethylaminocinnamaldehyde R* in a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *alcohol R*. Examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than 2 such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 ml of *dilute hydrochloric acid R*. Carry out the determination of primary aromatic amino-nitrogen (2.5.8).

1 ml of 0.1 M *sodium nitrite* is equivalent to 12.42 mg of C₁₂H₁₂N₂O₂S.

STORAGE

Store protected from light.

01/2005:0662

DAUNORUBICIN HYDROCHLORIDE

Daunorubicini hydrochloridum

 $C_{27}H_{30}ClNO_{10}$ M_r 564.0

DEFINITION

(8S,10S)-8-Acetyl-10-[(3-amino-2,3,6-trideoxy- α -L-lyxo-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione hydrochloride.

Substance produced by certain strains of *Streptomyces coeruleorubidus* or of *Streptomyces peucetius* or obtained by any other means.

Content: 95.0 per cent to 102.0 per cent (anhydrous and solvent-free substance).

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise the presence of histamine.

CHARACTERS

Appearance: crystalline, orange-red powder, hygroscopic.

Solubility: freely soluble in water and in methanol, slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: daunorubicin hydrochloride CRS.

B. Dissolve about 10 mg in 0.5 ml of *nitric acid R*, add 0.5 ml of *water R* and heat over a flame for 2 min. Allow to cool and add 0.5 ml of *silver nitrate solution R1*. A white precipitate is formed.

TESTS

pH (2.2.3): 4.5 to 6.5.

Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *daunorubicin hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *doxorubicin hydrochloride CRS* and 10 mg of *epirubicin hydrochloride CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *daunorubicinone CRS* and 5.0 mg of *doxorubicin hydrochloride CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: mixture of equal volumes of *acetonitrile R* and a solution containing 2.88 g/l of *sodium laurilsulfate R* and 2.25 g/l of *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 5 μ l; inject the test solution and reference solutions (b), (c) and (d).

Run time: twice the retention time of daunorubicin.

Relative retention with reference to daunorubicin (retention time = about 15 min): impurity A = about 0.4; impurity D = about 0.5; epirubicin = about 0.6; impurity B = about 0.7.

System suitability: reference solution (b):

- **resolution:** minimum of 2.0 between the peaks due to impurity D and epirubicin.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **impurity B:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (1.5 per cent),
- **impurity D:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent),
- **total of other impurities:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (2.5 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Butanol (2.4.24, *System B*): maximum 1.0 per cent.

Water (2.5.12): maximum 3.0 per cent, determined on 0.100 g.

Bacterial endotoxins (2.6.14): less than 4.3 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{27}H_{30}ClNO_{10}$.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R = CO-CH₃: (8*S*,10*S*)-8-acetyl-6,8,10,11-tetrahydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicin aglycone, daunorubicinone),
- E. R = CHOH-CH₃: (8*S*,10*S*)-6,8,10,11-tetrahydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (13-dihydrodaunorubicinone),

- B. R = CHOH-CH₃: (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L*-xylo-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicinol),
- C. R = CH₂-CO-CH₃: (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L*-xylo-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-8-(2-oxopropyl)-7,8,9,10-tetrahydrotetracene-5,12-dione (feudomycin B),
- D. R = CO-CH₂-OH: doxorubicin,
- F. R = CO-CH₂-CH₃: (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L*-xylo-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-8-propanoyl-7,8,9,10-tetrahydrotetracene-5,12-dione (8-ethyl-daunorubicin).

01/2005:1307

DECYL OLEATE

Decylis oleas

DEFINITION

Decyl oleate is a mixture consisting of decyl esters of fatty acids, mainly oleic acid. A suitable antioxidant may be added.

CHARACTERS

A clear, pale yellow or colourless liquid, practically insoluble in water, miscible with alcohol, with methylene chloride and with light petroleum (40 °C to 60 °C).

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
- B. It complies with the test for saponification value (see Tests).
- C. It complies with the test for content of oleic acid (see Tests).

TESTS

Relative density (2.2.5): 0.860 to 0.870.

Acid value (2.5.1): Not more than 1.0, determined on 10.0 g.

Iodine value (2.5.4): 55 to 70.

Peroxide value (2.5.5): Not more than 10.0.

Saponification value (2.5.6): 130 to 140, determined on 2.0 g.

Content of oleic acid (2.4.22, Method A). The fatty acid fraction of the substance contains at least 60.0 per cent of oleic acid.

Water (2.5.12): Not more than 1.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Total ash (2.4.16): Not more than 0.1 per cent, determined on 2.0 g.

STORAGE

Store protected from light.

LABELLING

The label states, where applicable, the name and concentration of any added antioxidant.

01/2005:0896

DEFEROXAMINE MESILATE

Deferoxamini mesilas

C₂₆H₅₂N₆O₁₁SM_r 657

DEFINITION

Deferoxamine mesilate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent expressed as *N*'-[5-[[4-[[5-(acetylhydroxyamino)pentyl]amino]-4-oxobutanoyl]hydroxyamino]pentyl]-*N*-(5-aminopentyl)-*N*-hydroxybutanediamide methanesulfonate, calculated with reference to the anhydrous substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A white or almost white powder, freely soluble in water, slightly soluble in methanol, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *deferoxamine mesilate CRS*. Examine the substances prepared as discs. If the spectra obtained show

differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.

- B. Dissolve about 5 mg in 5 ml of *water R*. Add 2 ml of a 5 g/l solution of *trisodium phosphate dodecahydrate R* and 0.5 ml of a 25 g/l solution of *sodium naphthoquinonesulphonate R*. A brownish-black colour develops.
- C. The titrated solution obtained in the Assay (solution (a)) is brownish-red. To 10 ml of solution (a) add 3 ml of *ether R*. Shake. The organic layer is colourless. To 10 ml of solution (a) add 3 ml of *benzyl alcohol R*. Shake. The organic layer is brownish-red.
- D. Dissolve 0.1 g in 5 ml of *dilute hydrochloric acid R*. Add 1 ml of *barium chloride solution R2*. The solution is clear. In a porcelain crucible, mix 0.1 g with 1 g of *anhydrous sodium carbonate R*, heat and ignite over a naked flame. Allow to cool. Dissolve the residue in 10 ml of *water R*, heating if necessary, and filter. The filtrate gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of freshly prepared solution S is 3.7 to 5.5.

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use, protected from light.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *desferoxamine mesilate CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 25.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 2 ml/min a solution prepared as follows: dissolve 1.32 g of *ammonium phosphate R* and 0.37 g of *sodium edetate R* in 950 ml of *water R*; adjust to pH 2.8 with *phosphoric acid R* (about 3–4 ml) and add 55 ml of *tetrahydrofuran R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (a). If a recorder is used, adjust the sensitivity of the detector so that the height of the peak with a relative retention time of about 0.8 is not less than 15 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peak with the relative retention time of about 0.8 and the principal peak is at least 1.0.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 3 times the retention time of desferoxamine. In the chromatogram

obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent); the sum of the area of any such peaks is not greater than 1.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (7.0 per cent). Disregard any peak with an area less than 0.02 times that of the principal peak in the chromatogram obtained with reference solution (b).

Chlorides (2.4.4). Dilute 2 ml of solution S to 20 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides (330 ppm).

Sulphates (2.4.13). Dilute 5 ml of solution S to 20 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (400 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 2.0 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.025 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.500 g in 25 ml of *water R*. Add 4 ml of 0.05 M *sulphuric acid*. Titrate with 0.1 M *ferric ammonium sulphate*. Towards the end of the titration, titrate uniformly and at a rate of about 0.2 ml/min. Determine the end-point potentiometrically (2.2.20) using a platinum indicator electrode and a calomel reference electrode. Retain the titrated solution for identification test C.

1 ml of 0.1 M *ferric ammonium sulphate* is equivalent to 65.68 mg of C₂₆H₅₂N₆O₁₁S.

STORAGE

Store protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. *N'*-[5-[4-[4-(acetylhydroxyamino)butyl]amino]-4-oxobutanoyl]hydroxyamino]pentyl]-*N*-(5-aminopentyl)-*N*-hydroxybutanediamide (desferrioxamine A₁),

B. other desferrioxamines.

01/2005:0176 TESTS

DEMECLOCYCLINE HYDROCHLORIDE

Demeclocyclini hydrochloridum

$C_{21}H_{22}Cl_2N_2O_8$

M_r 501.3

DEFINITION

(4S,4aS,5aS,6S,12aS)-7-Chloro-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride.

Substance produced by certain strains of *Streptomyces aureofaciens* or obtained by any other means.

Content: 89.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow powder.

Solubility: soluble or sparingly soluble in water, slightly soluble in alcohol, very slightly soluble in acetone. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *demeclocycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *demeclocycline hydrochloride CRS*, 5 mg of *chlortetracycline hydrochloride R* and 5 mg of *tetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel F_{254} plate *R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 μ l.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A violet colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.

C. It gives reaction (a) of chlorides (2.3.1).

pH (2.2.3): 2.0 to 3.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): –248 to –263 (anhydrous substance).

Dissolve 0.250 g in 0.1 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Specific absorbance (2.2.25): 340 to 370 determined at the maximum at 385 nm (anhydrous substance).

Dissolve 10.0 mg in 0.01 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. To 10.0 ml of the solution add 12 ml of *dilute sodium hydroxide solution R* and dilute to 100.0 ml with *water R*.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 25.0 mg of the substance to be examined in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *demeclocycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 5.0 mg of *4-epidemeclocycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (c). Mix 1.0 ml of reference solution (a) and 5.0 ml of reference solution (b) and dilute to 25.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (d). Dilute 5.0 ml of reference solution (a) to 100.0 ml with 0.01 M *hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (8 μ m),
- temperature: 60 °C,

Mobile phase: weigh 80.0 g of *2-methyl-2-propanol R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*; add 100 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 with *dilute phosphoric acid R*, 150 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R*; dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (c) and (d).

System suitability: reference solution (c):

- resolution: minimum of 2.8 between the peaks due to impurity B (1st peak) and demeclocycline (2nd peak); if necessary, adjust the 2-methyl-2-propanol content of the mobile phase or lower the pH of the mobile phase,
- symmetry factor: maximum 1.25 for the peak due to demeclocycline.

Limits:

- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (5.0 per cent), and not more than 1 such peak has an area greater than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (d) (4.0 per cent),

- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (10.0 per cent),
- *disregard limit*: 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the standard using 2.5 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 3.0 per cent, determined on 1.000 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{21}H_{22}Cl_2N_2O_8$.

STORAGE

Protected from light.

IMPURITIES

- A. (4*S*,4*aS*,5*aS*,6*S*,12*aS*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracycline-2-carboxamide (demethyltetracycline),

- B. (4*R*,4*aS*,5*aS*,6*S*,12*aS*)-7-chloro-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracycline-2-carboxamide (4-epidemeclocycline).

01/2005:1308

DEPTROPINE CITRATE

Deptropini citras

$C_{29}H_{35}NO_8$

M_r 525.6

DEFINITION

Deptropine citrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (1*R*,3*r*,5*S*)-3-(10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-yloxy)-8-methyl-8-azabicyclo[3.2.1]octane dihydrogen citrate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, microcrystalline powder, very slightly soluble in water and in ethanol, practically insoluble in methylene chloride.

It melts at about 170 °C, with decomposition.

IDENTIFICATION

First identification: A.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *deptropine citrate CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).
- To about 1 mg add 0.5 ml of *sulphuric acid R*. A stable red-orange colour develops.
- Dissolve about 1 mg in 0.25 ml of *perchloric acid R* and warm gently until the solution becomes turbid. Add 5 ml of *glacial acetic acid R*; a pink colour with an intense green fluorescence appears.
- To about 5 mg add 1 ml of *acetic anhydride R* and 5 ml of *pyridine R*. A purple colour develops.

TESTS

pH (2.2.3). Suspend 0.25 g in *carbon dioxide-free water R*, dilute to 25 ml with the same solvent and filter. The pH of the solution is 3.7 to 4.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with *methanol R*.

Reference solution (b). Dissolve 20 mg of *deptropine citrate CRS* in *methanol R* and dilute to 2 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *methanol R*.

Reference solution (c). Dissolve 5 mg of *tropine CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Dissolve 10 mg of *deptropine citrate CRS* and 10 mg of *tropine CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Apply to the plate 40 µl of each solution. Develop over a path of 10 cm using a mixture of 8 volumes of *concentrated ammonia R* and 92 volumes of *butanol R*. Dry the plate at 100 °C to 105 °C until the ammonia has completely evaporated. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent). Spray with *dilute potassium iodobismuthate solution R* and then with a 10 g/l solution

of *sodium nitrite R*. Expose the plate to iodine vapours. Examine in daylight and in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot corresponding to tropine is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent); any spot, apart from the principal spot and any spot corresponding to tropine, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 52.56 mg of $C_{29}H_{35}NO_8$.

STORAGE

Store protected from light.

IMPURITIES

A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]octan-3-ol (tropine),

B. (1*R*,3*s*,5*S*)-3-(10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-yloxy)-8-methyl-8-azabicyclo[3.2.1]octane (pseudodeptropine),

C. 10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-ol (dibenzocycloheptadienol),

D. (1*R*,3*r*,5*S*)-3-(10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-yloxy)-8-azabicyclo[3.2.1]octane (demethyldeptropine).

01/2005:1413

DEQUALINIUM CHLORIDE

Dequalinii chloridum

$C_{30}H_{40}Cl_2N_4$

M_r 527.6

DEFINITION

Dequalinium chloride contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of 1,1'-(decane-1,10-diyl)bis(4-amino-2-methylquinolinium) dichloride, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, hygroscopic, slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Dissolve about 10 mg in *water R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *water R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 240 nm and 326 nm and a shoulder at 336 nm. The ratio of the absorbance measured at the maximum at 240 nm to that measured at the maximum at 326 nm is 1.56 to 1.80 and the ratio of the absorbance measured at the maximum at 326 nm to that measured at the shoulder at 336 nm is 1.12 to 1.30.
- Examine by infrared absorption spectrophotometry between 600 cm^{-1} and 2000 cm^{-1} (2.2.24), comparing with the spectrum obtained with *dequalinium chloride CRS*.
- To 5 ml of solution S (see Tests) add 5 ml of *potassium ferricyanide solution R*. A yellow precipitate is formed.
- To 10 ml of solution S add 1 ml of *dilute nitric acid R*. A white precipitate is formed. Filter and reserve the filtrate for identification test E.
- The filtrate from identification test D gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.2 g in 90 ml of *carbon dioxide-free water R*, heating if necessary, and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 5 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *dequalinium chloride for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *dequalinium chloride CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with an *end-capped octadecylsilyl silica gel for chromatography R*,
- as mobile phase at a flow rate of 1.5 ml/min the following solution: dissolve 2 g of *sodium hexanesulphonate R* in 300 ml of *water R*. Adjust to pH 4.0 with *acetic acid R* and add 700 ml of *methanol R*,
- as detector a spectrophotometer set at 240 nm.

Adjust the sensitivity of the system so that the height of the peak due to impurity B in the chromatogram obtained with 10 µl of reference solution (a) is at least 25 per cent of the full scale of the recorder. Measure the height (*A*) above the baseline of the peak due to impurity B and the height (*B*) above the baseline at the lowest point of the curve separating this peak from the peak due to dequalinium chloride. The test is not valid unless *A* is greater than twice *B*. If necessary, adjust the concentration of methanol in the mobile phase.

Inject 10 µl of the test solution and 10 µl of reference solution (b). Continue the chromatography of the test solution for 5 times the retention time of the peak due to dequalinium chloride. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); and the sum of the areas of all the peaks, apart from the principal peak, is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (10 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Readily carbonisable substances. Dissolve 20 mg in 2 ml of *sulphuric acid R*. After 5 min the solution is not more intensely coloured than reference solution BY₄ (2.2.2, Method I).

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 1.000 g by drying at 100–105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in 5 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M perchloric acid is equivalent to 26.38 mg of C₃₀H₄₀Cl₂N₄.

STORAGE

In an airtight container.

IMPURITIES

A. 2-methylquinolin-4-amine,

B. 4-amino-1-[10-[(2-methylquinolin-4-yl)amino]decyl]-2-methylquinolinium chloride,

C. 1-[10-(4-amino-2-methylquinolinio)decyl]-4-[[10-(4-amino-2-methylquinolinio)decyl]amino]-2-methylquinolinium trichloride.

01/2005:0481

DESIPRAMINE HYDROCHLORIDE

Desipramini hydrochloridum

C₁₈H₂₃ClN₂

M_r 302.8

DEFINITION

Desipramine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-(10,11-dihydro-5H-dibenzo[*b,f*]azepin-5-yl)-*N*-methylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water and in alcohol.

It melts at about 214 °C.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 40.0 mg in 0.01 M hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of the solution to 100.0 ml with 0.01 M hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 251 nm and a shoulder at 270 nm. The specific absorbance at the maximum is 255 to 285.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *desipramine hydrochloride CRS*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 50 mg in 3 ml of *water R* and add 0.05 ml of a 25 g/l solution of *quinhydrone R* in *methanol R*. An intense pink colour develops within about 15 min.
- E. To 0.5 ml of solution S (see Tests) add 1.5 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R*, warming to not more than 30 °C if necessary, and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S, examined immediately after preparation, is not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.3 ml of 0.01 M sodium hydroxide. The solution is yellow. Not more than 0.5 ml of 0.01 M hydrochloric acid is required to change the colour of the indicator to red.

Related substances. Carry out the test protected from bright light. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *ethanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of equal volumes of *ethanol R* and *methylene chloride R*.

Reference solution (a). Dissolve 25 mg of *desipramine hydrochloride CRS* in a mixture of equal volumes of *ethanol R* and *methylene chloride R* and dilute to 25 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution (b). Dilute 1 ml of reference solution (a) to 50 ml with a mixture of equal volumes of *ethanol R* and *methylene chloride R*.

Apply to the plate 5 µl of each solution. Develop over a path of 7 cm using a mixture of 1 volume of *water R*, 10 volumes of *anhydrous acetic acid R* and 10 volumes of *toluene R*. Dry the plate in a current of air for 10 min, spray with a 5 g/l solution of *potassium dichromate R* in a mixture of 1 volume of *sulphuric acid R* and 4 volumes of *water R* and examine immediately. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 4 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2500 g in a mixture of 5 ml of 0.01 M hydrochloric acid and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 30.28 mg of C₄₇H₇₄O₁₉.

STORAGE

Store protected from light.

01/2005:0482

DESLANOSIDE

Deslanosidum

C₄₇H₇₄O₁₉M_r 943

DEFINITION

Deslanoside contains not less than 95.0 per cent and not more than the equivalent of 105.0 per cent of 3β-[(O-β-D-glucopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl)-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl]oxy]-12β,14-dihydroxy-5β,14β-card-20(22)-enolide, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline or finely crystalline powder, hygroscopic, practically insoluble in water, very slightly soluble in alcohol. In an atmosphere of low relative humidity, it loses water.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *deslanoside CRS*. When comparing the spectra, special attention is given to the absence of a distinct absorption maximum at about 1260 cm^{-1} and to the intensity of the absorption maximum at about 1740 cm^{-1} . Examine the substances in discs prepared by dissolving 1 mg of the substance to be examined or 1 mg of the reference substance in 0.3 ml of *methanol R* and triturating with about 0.4 g of dry, finely powdered *potassium bromide R* until the mixture is uniform and completely dry.
- B. Examine the chromatograms obtained in the test for related substances. The principal band in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal band in the chromatogram obtained with reference solution (a).
- C. Suspend about 0.5 mg in 0.2 ml of *alcohol (60 per cent V/V) R*. Add 0.1 ml of *dinitrobenzoic acid solution R* and 0.1 ml of *dilute sodium hydroxide solution R*. A violet colour develops.
- D. Dissolve about 5 mg in 5 ml of *glacial acetic acid R* and add 0.05 ml of *ferric chloride solution R1*. Cautiously add 2 ml of *sulphuric acid R*, avoiding mixing the two liquids. Allow to stand; a brown but not reddish ring develops at the interface and a greenish-yellow, then bluish-green colour diffuses from it to the upper layer.

TESTS

Solution S. Dissolve 0.20 g in a mixture of equal volumes of *chloroform R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.200 g in *anhydrous pyridine R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is $+6.5$ to $+8.5$, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Use solution S.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of equal volumes of *chloroform R* and *methanol R*.

Reference solution (a). Dissolve 20 mg of *deslanoside CRS* in a mixture of equal volumes of *chloroform R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 10 ml with a mixture of equal volumes of *chloroform R* and *methanol R*.

Reference solution (c). Dilute 1 ml of reference solution (a) to 10 ml with a mixture of equal volumes of *chloroform R* and *methanol R*.

Apply separately to the plate as 10 mm bands 5 μl of each solution. Develop immediately over a path of 15 cm using a mixture of 3 volumes of *water R*, 36 volumes of *methanol R* and 130 volumes of *methylene chloride R*. Dry the plate in a current of warm air, spray with a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *alcohol R* and heat at $140\text{ }^{\circ}\text{C}$ for 15 min. Examine in daylight. In the chromatogram obtained with test solution (a), any band, apart from the principal band, is not more intense than the band in the chromatogram obtained with reference solution (b) (2.5 per cent) and at most two such bands are more intense than the band in the chromatogram obtained with reference solution (c) (1.0 per cent).

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.500 g by drying *in vacuo* at $100\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *alcohol R*. Prepare a reference solution in the same manner, using 50.0 mg of *deslanoside CRS* (undried). To 5.0 ml of each solution add 3.0 ml of *alkaline sodium picrate solution R* and allow to stand protected from bright light in a water-bath at $20 \pm 1\text{ }^{\circ}\text{C}$ for 40 min. Measure the absorbance (2.2.25) of each solution at the maximum at 484 nm, using as the compensation liquid a mixture of 3.0 ml of *alkaline sodium picrate solution R* and 5.0 ml of *alcohol R* prepared at the same time.

Calculate the content of $\text{C}_{47}\text{H}_{74}\text{O}_{19}$ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store in an airtight, glass container, protected from light, at a temperature below $10\text{ }^{\circ}\text{C}$.

01/2005:0712

DESMOPRESSIN

Desmopressinum

 $\text{C}_{46}\text{H}_{64}\text{N}_{14}\text{O}_{12}\text{S}_2$
 $M_r\ 1069$

DEFINITION

Desmopressin is a synthetic cyclic nonapeptide having an antidiuretic action. It contains not less than 95.0 per cent and not more than the equivalent of 105.0 per cent of the peptide $\text{C}_{46}\text{H}_{64}\text{N}_{14}\text{O}_{12}\text{S}_2$, calculated with reference to the anhydrous, acetic acid-free substance. It is available as an acetate.

CHARACTERS

A white, fluffy powder, soluble in water, in alcohol and in glacial acetic acid.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with the reference solution.

TESTS

Specific optical rotation (2.2.7). Dissolve 10.0 mg in a 1 per cent *V/V* solution of *glacial acetic acid R* and dilute to 5.0 ml with the same acid. The specific optical rotation is -72 to -82 , calculated with reference to the anhydrous, acetic acid-free substance.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

lysine	threonine	alanine	leucine
histidine	serine	valine	tyrosine
arginine	glutamic acid	methionine	phenylalanine
aspartic acid	proline	isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Add a suitable amount of a 50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at -5°C , reduce the pressure to below 133 Pa and seal. Heat at 110°C to 115°C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking one-sixth of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, arginine and phenylalanine as equal to one. The values fall within the following limits: aspartic acid 0.95 to 1.05; glutamic acid 0.95 to 1.05; proline 0.95 to 1.05; glycine 0.95 to 1.05; arginine 0.95 to 1.05; phenylalanine 0.95 to 1.05; tyrosine 0.70 to 1.05; half-cystine 0.30 to 1.05. Lysine, isoleucine and leucine are absent; not more than traces of other amino acids are present.

Related peptides. Examine by liquid chromatography (2.2.29) as described under Assay, following the elution conditions shown in the table below, at a flow rate of 1.5 ml/min:

Time (min)	Mobile phase A (per cent <i>V/V</i>)	Mobile phase B (per cent <i>V/V</i>)	Comment
0 - 4	76	24	isocratic
4 - 18	76 → 58	24 → 42	linear gradient
18 - 35	58 → 48	42 → 52	linear gradient
35 - 40	48 → 76	52 → 24	switch to initial eluent composition
40 - 50	76	24	re-equilibration

Inject 50 µl of the resolution solution and identify the peaks due to desmopressin and oxytocin (first and second peaks, respectively). If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain a retention time of about 16 min for the desmopressin peak. The test is not valid unless the resolution between the peaks corresponding to desmopressin and oxytocin is at least 1.5.

Inject 50 µl of the test solution. In the chromatogram obtained the area of any peak, apart from the principal peak, is not greater than 0.5 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 per cent of the total

area of the peaks. Disregard any peak due to the solvent and any peak with an area less than 0.05 per cent of that of the principal peak.

Acetic acid (2.5.34): 3.0 per cent to 8.0 per cent.

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.32). Not more than 6.0 per cent, determined by the micro determination of water.

Bacterial endotoxins (2.6.14): less than 500 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 1.0 mg of the substance to be examined in 2.0 ml of *water R*.

Reference solution. Dissolve the contents of a vial of *desmopressin CRS* in *water R* to obtain a concentration of 0.5 mg/ml.

Resolution solution. Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture CRS* in 500 µl of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.0 ml/min a mixture of 60 volumes of mobile phase A and 40 volumes of mobile phase B:

Mobile phase A. 0.067 M phosphate buffer solution pH 7.0 *R*; filter and degas,

Mobile phase B. Mix equal volumes of mobile phase A and of *acetonitrile for chromatography R*; filter and degas,

- as detector a spectrophotometer set at 220 nm.

Inject 50 µl of the resolution solution and identify the peaks due to desmopressin and oxytocin (first and second peaks, respectively). If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain a retention time of about 5 min for the desmopressin peak. The test is not valid unless the resolution between the peaks corresponding to desmopressin and oxytocin is at least 1.5.

Inject 50 µl of the test solution and 50 µl of the reference solution.

Calculate the content of desmopressin ($\text{C}_{46}\text{H}_{64}\text{N}_{14}\text{O}_{12}\text{S}_2$) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of $\text{C}_{46}\text{H}_{64}\text{N}_{14}\text{O}_{12}\text{S}_2$ in *desmopressin CRS*.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2°C to 8°C . If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the mass of peptide per container,
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0322

DESOXYCORTONE ACETATE

Desoxycortoni acetat

 $C_{23}H_{32}O_4$ M_r 372.5

DEFINITION

Desoxycortone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 3,20-dioxopregn-4-en-21-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, practically insoluble in water, freely soluble in methylene chloride, soluble in acetone, sparingly soluble in alcohol, slightly soluble in propylene glycol and in fatty oils.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 157 °C to 161 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *desoxycortone acetate CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *desoxycortone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *cortisone acetate R* in reference solution (a) and dilute to 10 ml with reference solution (a).

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot

in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a yellow colour develops. Add the solution to 2 ml of *water R* and shake. The resulting solution is dichroic showing an intense blue colour by transparency, and red fluorescence which is particularly intense in ultraviolet light at 365 nm.
- E. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 171 to + 179, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *desoxycortone acetate CRS* and 2 mg of *betamethasone 17-valerate CRS* in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 350 ml of *water R* with 600 ml of *acetonitrile R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone 17-valerate, about 7.5 min and desoxycortone acetate, about 9.5 min. The test is not valid unless the resolution between the peaks due to betamethasone 17-valerate and desoxycortone acetate is at least 4.5; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 240 nm.

Calculate the content of $C_{23}H_{32}O_4$ taking the specific absorbance to be 450.

STORAGE

Store protected from light.

01/2005:1414
corrected

DETOMIDINE HYDROCHLORIDE FOR VETERINARY USE

Detomidini hydrochloridum ad usum
veterinarium

$C_{12}H_{15}ClN_2$

M_r 222.7

DEFINITION

Detomidine hydrochloride for veterinary use contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 4-(2,3-dimethylbenzyl)-1H-imidazole hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, hygroscopic, crystalline powder, soluble in water, freely soluble in alcohol, very slightly soluble in methylene chloride, practically insoluble in acetone.

It melts at about 160 °C.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *detomidine hydrochloride CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dry the substance to be examined and the reference substance in an oven at 100 °C to 105 °C and record new spectra.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.25 g in *water R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 20 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 0.20 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 1 mg of *detomidine impurity B CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 1 ml of the solution to 10 ml with reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 35 volumes of *acetonitrile R* and 65 volumes of a 2.64 g/l solution of *ammonium phosphate R*,
- as detector a spectrophotometer set at 220 nm.

When the chromatograms are recorded in the prescribed conditions, the retention time of detomidine is about 7 min and the relative retention times of impurities A, B and C with respect to detomidine are about 0.4, 2.0 and 3.0, respectively. Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b). The test is not valid unless: the resolution between the peaks corresponding to detomidine and to impurity B is at least 5.

Inject 20 µl of the test solution. Continue the chromatography for four times the retention time of the principal peak. Multiply the area of any peak (corresponding to the impurity C and its diastereoisomer) eluting with a relative retention time of about 3, by the correction factor 2.7. The sum of the areas of such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of any other peak apart from the principal peak and the peak corresponding to the impurity C is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g in 50 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflection.

1 ml of 0.1 M *sodium hydroxide* corresponds to 22.27 mg of $C_{12}H_{15}ClN_2$.

STORAGE

Store in an airtight container.

IMPURITIES

A. (RS)-(2,3-dimethylphenyl)(1H-imidazol-4-yl)methanol,

- B. (RS)-(1-benzyl-1H-imidazol-5-yl)(2,3-dimethylphenyl)methanol,

- C. 4-[(2,3-dimethylcyclohexyl)methyl]-1H-imidazole.

01/2005:1095

DEVIL'S CLAW ROOT

Harpagophyti radix

DEFINITION

Devil's claw root consists of the cut and dried tuberous, secondary roots of *Harpagophytum procumbens* D.C. and/or *H. zeyheri* L. Decne. It contains not less than 1.2 per cent of harpagoside ($C_{24}H_{30}O_{11}$; M_r 494.5), calculated with reference to the dried drug.

CHARACTERS

Devil's claw root is greyish-brown to dark brown and it has a bitter taste.

It has the macroscopic and microscopic characters described in identification tests A and B.

IDENTIFICATION

- A. It consists of thick, fan-shaped or rounded slices or of roughly crushed discs. The darker outer surface is traversed by tortuous longitudinal wrinkles. The paler cut surface shows a dark cambial zone and xylem bundles distinctly aligned in radial rows. The central cylinder shows fine concentric striations. Seen under a lens, the cut surface presents yellow to brownish-red granules.
- B. Reduce to a powder (355). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of cork layer consisting of yellowish-brown, thin-walled cells; fragments of cortical parenchyma consisting of large, thin-walled cells, sometimes containing reddish-brown granular inclusions and isolated yellow droplets; fragments of reticulately thickened vessels and tracheidal vessels with associated lignified parenchyma from the central cylinder; small needles and crystals of calcium oxalate are present in the parenchyma. The powder may show rectangular or polygonal pitted sclereids with dark reddish-brown contents. With a solution of phloroglucinol in hydrochloric acid, the parenchyma turns green.
- C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Heat on a water-bath at 60 °C for 10 min 1.0 g of the powdered drug (355) with 10 ml of *methanol R*. Filter and reduce the filtrate to about 2 ml under reduced pressure at a temperature not exceeding 40 °C.

Reference solution. Dissolve 1 mg of *harpagoside R* in 1 ml of *methanol R*.

Apply to the plate as bands 20 µl of each solution.

Develop over a path of 10 cm using a mixture of 8 volumes of *water R*, 15 volumes of *methanol R* and 77 volumes of *ethyl acetate R*. Dry the plate in a current of warm air. Examine in ultraviolet light at 254 nm. The chromatograms obtained with the test solution and the reference solution both show in the middle a quenching zone corresponding to harpagoside. The chromatogram obtained with the test solution shows other distinct bands, mainly above the zone corresponding to harpagoside. Spray with a 10 g/l solution of *phloroglucinol R* in *alcohol R* and then with *hydrochloric acid R*. Dry the plate at 80 °C for 5-10 min. In the chromatograms obtained with the reference solution and the test solution the zone corresponding to harpagoside is green. The chromatogram obtained with the test solution also shows several yellow to brown zones below and above the zone corresponding to harpagoside.

TESTS

Starch. Examine the powdered drug (355) under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

Foreign matter (2.8.2). It complies with the test for foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C.

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29) using *methyl cinnamate R* as the internal standard.

Internal standard solution. Dissolve 0.130 g of *methyl cinnamate R* in 50 ml of *methanol R* and dilute to 100.0 ml with the same solvent.

Test solution. To 0.500 g of the powdered drug (355) add 50 ml of *methanol R*. Shake for 1 h and filter. Transfer the filter with the residue to a 100 ml flask, add 50 ml of *methanol R* and heat under a reflux condenser for 1 h. Cool and filter. Rinse the flask and the filter with 2 quantities, each of 5 ml, of *methanol R*. Combine the filtrate and the rinsing solution and evaporate to dryness under reduced pressure at a temperature not exceeding 40 °C. Take up the residue with 3 quantities, each of 5 ml, of *methanol R* and filter the extracts into a 25 ml volumetric flask. Whilst washing the filter, dilute to 25.0 ml with *methanol R*. To 10.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 25.0 ml with *methanol R*.

Reference solution. Dilute 0.5 ml of the reference solution described in Identification test C to 2.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of equal volumes of *methanol R* and *water R*,
- as detector a spectrophotometer set at 278 nm,
- a 10 µl loop injector.

Inject the test solution. Adjust the sensitivity of the detector so that the height of the peak due to methyl cinnamate is about 50 per cent of the full scale of the recorder.

Determine the retention time of harpagoside using 10 µl of the reference solution examined under the same conditions as the test solution.

Calculate the percentage content of harpagoside from the expression:

$$\frac{m_2 \times F_1 \times 7.622}{F_2 \times m_1}$$

- m_1 = mass of the drug, in grams,
 m_2 = mass of *methyl cinnamate R*, in grams in the internal standard solution,
 F_1 = area of the peak corresponding to harpagoside in the chromatogram obtained with the test solution,
 F_2 = area of the peak corresponding to methyl cinnamate in the chromatogram obtained with the test solution.

STORAGE

Store protected from light.

DEXAMETHASONE

Dexamethasonum

$C_{22}H_{29}FO_5$

M_r 392.5

DEFINITION

Dexamethasone contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11 β ,17,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in ethanol, slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- A. Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of the solution in a stoppered test tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution at the maximum at 419 nm is not less than 0.4.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dexamethasone CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *dexamethasone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *betamethasone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply to the plate 5 μ l of each solution. Develop over a path of 15 cm, using a mixture of 5 volumes of *butanol R* saturated with *water R*, 10 volumes of *toluene R* and 85 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the chromatograms in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 spots which may, however, not be completely separated.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a faint reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged.
- E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 75 to + 80, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Place 25.0 mg of the substance to be examined in a 10.0 ml volumetric flask, add 1.5 ml of *acetonitrile R* and then 5 ml of mobile phase A. Mix with the aid of an ultrasonic bath until complete dissolution and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dissolve 2 mg of *dexamethasone CRS* and 2 mg of *methylprednisolone CRS* in mobile phase A and dilute to 100.0 ml with the same mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),

01/2005:0548

- as mobile phase at a flow rate of 2.5 ml/min a linear gradient programme using the following conditions:

Mobile phase A. In a 1000 ml volumetric flask, mix 250 ml of *acetonitrile R* with 700 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	100	0	isocratic
15	100 → 0	0 → 100	begin linear gradient
40	0	100	end chromatogram, return to 100 A
41	100	0	begin equilibration with A
46 = 0	100	0	end equilibration, begin next chromatogram

- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 45 °C.

Equilibrate the column for at least 30 min with mobile phase B at a flow rate of 2.5 ml/min and then with mobile phase A for 5 min. For subsequent chromatograms, use the conditions described from 40.0 min to 46.0 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: methylprednisolone about 11.5 min and dexamethasone about 13 min. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and dexamethasone is at least 2.8; if necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject 20 µl of mobile phase A as a blank, 20 µl of the test solution and 20 µl of reference solution (b). Record the chromatogram of the test solution for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak due to the blank and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238.5 nm.

Calculate the content of $C_{22}H_{29}FO_5$ taking the specific absorbance to be 394.

STORAGE

Protected from light.

DEXAMETHASONE ACETATE

Dexamethasoni acetat

 $C_{24}H_{31}FO_6$
 M_r 434.5

DEFINITION

Dexamethasone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β,17-dihydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in alcohol, slightly soluble in methylene chloride.

Dexamethasone acetate shows polymorphism.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E, F.

- Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution at the maximum at 419 nm is not less than 0.35.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dexamethasone acetate CRS*. If the spectra obtained in the solid state with the substance to be examined and the reference substance show differences, record further spectra using saturated solutions (about 30 g/l) of the substance to be examined and of the reference substance in *chloroform R* in a 0.2 mm cell.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *dexamethasone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *cortisone acetate R* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm.

Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a faint reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.
- F. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 84 to + 90, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in about 4 ml of *acetonitrile R* and dilute to 10.0 ml with *water R*.

Reference solution (a). Dissolve 2 mg of *dexamethasone acetate CRS* and 2 mg of *betamethasone acetate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 380 ml of *acetonitrile R* with 550 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone acetate, about

19 min and dexamethasone acetate, about 22 min. The test is not valid unless the resolution between the peaks due to betamethasone acetate and dexamethasone acetate is at least 3.3; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying *in vacuo* in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238.5 nm.

Calculate the content of $C_{24}H_{31}FO_6$ taking the specific absorbance to be 357.

STORAGE

Store protected from light.

DEXAMETHASONE SODIUM PHOSPHATE

Dexamethasoni natrii phosphas

$C_{22}H_{28}FNa_2O_8P$

M_r 516.4

DEFINITION

Dexamethasone sodium phosphate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β,17-dihydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl disodium phosphate, calculated with reference to the anhydrous, ethanol-free substance.

CHARACTERS

A white or almost white powder, very hygroscopic, freely soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E, F.

A. Dissolve 10.0 mg in 5 ml of *water R* and dilute to 100.0 ml with *ethanol R*. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at the maximum at 419 nm is at least 0.20.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dexamethasone sodium phosphate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness on a water-bath and record new spectra using the residues.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *dexamethasone sodium phosphate CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *prednisolone sodium phosphate CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm, using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots which may, however, not be completely separated.

D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a faint yellowish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains.

E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

F. To 40 mg add 2 ml of *sulphuric acid R* and heat gently until white fumes are evolved, add *nitric acid R* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water R*, heat until white fumes are again evolved, cool, add 10 ml of

water R and neutralise to *red litmus paper R* with *dilute ammonia R1*. The solution gives reaction (a) of sodium (2.3.1) and reaction (b) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

pH (2.2.3). Dilute 1 ml of solution S to 5 ml with *carbon dioxide-free water R*. The pH of the solution is 7.5 to 9.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 75 to + 83, calculated with reference to the anhydrous, ethanol-free substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *dexamethasone sodium phosphate CRS* and 2 mg of *betamethasone sodium phosphate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 250 ml conical flask, weigh 1.360 g of *potassium dihydrogen phosphate R* and 0.600 g of *hexylamine R*, mix and allow to stand for 10 min and then dissolve in 182.5 ml of *water R*; add 67.5 ml of *acetonitrile R*, mix and filter (0.45 µm),
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 45 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone sodium phosphate, about 12.5 min and dexamethasone sodium phosphate about 14 min. The test is not valid unless the resolution between the peaks corresponding to betamethasone sodium phosphate and dexamethasone sodium phosphate is at least 2.2. If necessary, adjust slightly the concentration of acetonitrile or increase the concentration of water in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Inorganic phosphates. Dissolve 50 mg in *water R* and dilute to 100 ml with the same solvent. To 10 ml of this solution add 5 ml of *molybdovanadic reagent R*, mix and allow to stand for 5 min. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 10 ml of *phosphate standard solution (5 ppm PO₄) R* (1 per cent).

Ethanol. Not more than 3.0 per cent *m/m*, determined by gas chromatography (2.2.28), using *propanol R* as the internal standard.

Internal standard solution. Dilute 1.0 ml of *propanol R* to 100.0 ml with *water R*.

Test solution. Dissolve 0.50 g of the substance to be examined in 5.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

Reference solution. Dilute 1.0 g of *ethanol R* to 100.0 ml with *water R*. To 2.0 ml of the solution add 5.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*. The chromatographic procedure may be carried out using:

- a column 1 m long and 3.2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R1* (150 µm to 180 µm),
 - *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
 - a flame-ionisation detector,
- maintaining the temperature of the column at 150 °C, that of the injection port at 250 °C and that of the detector at 280 °C. Inject 2 µl of each solution.

Ethanol and water. Determine the water content using 0.200 g by the semi-micro determination of water (2.5.12). Add the percentage content of water and the percentage content of ethanol obtained in the test for ethanol. The sum of the percentage contents of water and ethanol is not greater than 13.0 per cent *m/m*.

ASSAY

Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 500.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 241.5 nm.

Calculate the content of C₂₂H₂₈FN₂O₈P taking the specific absorbance to be 303.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. dexamethasone,
- B. betamethasone sodium phosphate.

01/2005:1196

DEXCHLORPHENIRAMINE MALEATE

Dexchlorpheniramine maleate

C₂₀H₂₃ClN₂O₄

M_r 390.9

DEFINITION

Dexchlorpheniramine maleate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of (3*S*)-3-(4-chlorophenyl)-*N,N*-dimethyl-3-(pyridin-2-yl)propan-1-amine (*Z*)-butanedioate, calculated with reference to the dried substance.

CHARACTERS

A white crystalline powder, very soluble in water, freely soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

First identification: A, C, E.

Second identification: A, B, D, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Melting point (2.2.14): 110 °C to 115 °C.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dexchlorpheniramine maleate CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- D. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution. Dissolve 56 mg of *maleic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 3 volumes of *water R*, 7 volumes of *anhydrous formic acid R*, 20 volumes of *methanol R* and 70 volumes of *di-isopropyl ether R*. Allow the plate to dry in a current of air for a few minutes and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows two clearly separated spots. The upper spot is similar in position and size to the spot in the chromatogram obtained with the reference solution.

- E. To 0.15 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 10 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

pH (2.2.3). Dissolve 0.20 g in 20 ml of *water R*. The pH of the solution is 4.5 to 5.5.

Specific optical rotation (2.2.7): + 22 to + 23, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 10.0 mg in 1.0 ml of *methylene chloride R*.

Reference solution. Dissolve 5.0 mg of *brompheniramine maleate CRS* in 0.5 ml of *methylene chloride R* and add 0.5 ml of the test solution. Dilute 0.5 ml of this solution to 50.0 ml with *methylene chloride R*.

The chromatographic procedure may be carried out using:

- a glass column 2.3 m long and 2 mm in internal diameter packed with acid- and base- washed *silanised diatomaceous earth for gas chromatography R* (135 µm to 175 µm) impregnated with 3 per cent *m/m* of a mixture of 50 per cent of poly(dimethyl)siloxane and 50 per cent of poly(diphenyl)siloxane,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 20 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 205 °C and that of the injection port and of the detector at 250 °C.

Inject 1 µl of the reference solution. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the two peaks corresponding to dexchlorpheniramine and brompheniramine is at least 1.5. Inject 1 µl of the test solution. Continue the chromatography for at least 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: none of the peaks, apart from the principal peak, has an area greater than 0.8 times the area of the peak corresponding to dexchlorpheniramine in the chromatogram obtained with the reference solution (0.4 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the peak corresponding to dexchlorpheniramine in the chromatogram obtained with the reference solution (1 per cent).

Enantiomeric purity. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg in 3 ml of *water R*. Add a few drops of *concentrated ammonia R* until an alkaline reaction is produced. Shake with 5 ml of *methylene chloride R*. Separate the layers. Evaporate the lower, methylene chloride layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *dexchlorpheniramine maleate CRS* in 3 ml of *water R*. Add a few drops of *concentrated ammonia R* until an alkaline reaction is produced. Shake with 5 ml of *methylene chloride R*. Separate the layers. Evaporate the lower, methylene chloride layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 10.0 mg of *chlorphenamine maleate CRS* in 3 ml of *water R*. Add a few drops of *concentrated ammonia R* until an alkaline reaction is produced. Shake with 5 ml of *methylene chloride R*. Separate the layers. Evaporate the lower, methylene chloride layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of the test solution to 50 ml with *2-propanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *amylose derivative of silica gel for chromatography R*,
- as mobile phase at a flow rate of 1 ml/min a mixture of 3 volumes of *diethylamine R*, 20 volumes of *2-propanol R* and 980 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

Under these conditions the peak of the (*S*)-isomer appears first.

Inject 10 µl of each solution. The test is not valid unless: in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to the (*R*)-enantiomer and to the (*S*)-enantiomer is at least 1.5; the retention times of the principal peaks in the chromatograms obtained with the test solution and reference solution (a) are identical ((*S*)-enantiomer). In the chromatogram obtained with the test solution, the area of the peak corresponding to the (*R*)-enantiomer is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (2 per cent) and the area of any peak, apart from the principal peak and any peak corresponding to the (*R*)-enantiomer, is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 65 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 19.54 mg of C₂₀H₂₃ClN₂O₄.

STORAGE

Store protected from light.

IMPURITIES

A. (3*RS*)-*N,N*-dimethyl-3-phenyl-3-(pyridin-2-yl)propan-1-amine,

B. (3*R*)-3-(4-chlorophenyl)-*N,N*-dimethyl-3-(pyridin-2-yl)propan-1-amine.

01/2005:0761

DEXPANTHENOL

Dexpanthenolum

C₉H₁₉NO₄

*M*_r 205.3

DEFINITION

Dexpanthenol contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-2,4-dihydroxy-*N*-(3-hydroxypropyl)-3,3-dimethylbutanamide, calculated with reference to the anhydrous substance.

CHARACTERS

A colourless or slightly yellowish, viscous hygroscopic liquid, or a white or almost white, crystalline powder, very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dexpanthenol CRS*. Examine the substances using discs prepared as follows: dissolve the substance to be examined and the reference substance separately in 1.0 ml of *anhydrous ethanol R* to obtain a concentration of 5 mg/ml. Place dropwise 0.5 ml of this solution on a disc of *potassium bromide R*. Dry the disc at 100–105 °C for 15 min.
- C. Examine the chromatograms obtained in the test for 3-aminopropanol. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To 1 ml of solution S (see Tests) add 1 ml of *dilute sodium hydroxide solution R* and 0.1 ml of *copper sulphate solution R*. A blue colour develops.

TESTS

Solution S. Dissolve 2.500 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is not greater than 10.5.

Specific optical rotation (2.2.7). The specific optical rotation is + 29.0 to + 32.0, determined on solution S and calculated with reference to the anhydrous substance.

3-Aminopropanol. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.25 g of the substance to be examined in *anhydrous ethanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *anhydrous ethanol R*.

Reference solution (a). Dissolve the contents of a vial of *dexpanthenol CRS* in 1.0 ml of *anhydrous ethanol R* to obtain a concentration of 5 mg/ml.

Reference solution (b). Dissolve 25 mg of 3-aminopropanol *R* in *anhydrous ethanol R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *concentrated ammonia R*, 25 volumes of *methanol R* and 55 volumes of *butanol R*. Allow the plate to dry in air, spray with a 100 g/l solution of *trichloroacetic acid R* in *methanol R* and heat at 150 °C for 10 min. Spray with a 1 g/l solution of *ninhydrin R* in *methanol R* and heat at 120 °C until a colour appears. Any spot due to 3-aminopropanol

in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.000 g.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.400 g add 50.0 ml of 0.1 *M perchloric acid*. Boil under a reflux condenser for 5 h protected from humidity. Allow to cool. Add 50 ml of *dioxan R* by rinsing the condenser, protected from humidity. Add 0.2 ml of *naphtholbenzein solution R* and titrate with 0.1 *M potassium hydrogen phthalate* until the colour changes from green to yellow. Carry out a blank titration.

1 ml of 0.1 *M perchloric acid* is equivalent to 20.53 mg of C₉H₁₉NO₄.

STORAGE

In an airtight container.

01/2005:1506

DEXTRAN 1 FOR INJECTION

Dextranum 1 ad iniectabile

DEFINITION

Dextran 1 for injection is a low molecular weight fraction of dextran, consisting of a mixture of isomaltooligosaccharides. The average relative molecular mass is about 1000.

PRODUCTION

It is obtained by hydrolysis and fractionation of dextrans produced by fermentation of sucrose using *Leuconostoc mesenteroides* strain NRRL B-512 = CIP 78.59 or substrains thereof (for example *L. mesenteroides* B-512 F = NCTC 10817).

It is prepared in conditions designed to minimise the risk of microbial contamination.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 3.000 g in *water R*, heat on a water-bath and dilute to 100.0 ml with the same solvent. The specific optical rotation (2.2.7) is + 148 to + 164, calculated with reference to the dried substance. Dry an aliquot of the solution first on a water-bath and then to constant weight *in vacuo* at 70 °C. Calculate the dextran content after correction for the content of sodium chloride.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dextran 1 CRS*. Prepare the discs as follows: to 1–2 mg add one or a few drops of *water R*; grind in an agate mortar for 1–2 min; add about 300 mg of *potassium bromide R* and mix to a slurry (do not grind); dry *in vacuo* at 40 °C for 15 min, crush the residue (if it is not dry, dry for another 15 min). Prepare a disc using *potassium bromide R*. Run the infrared spectrum with a blank disc using *potassium bromide R* in the reference beam.

C. It complies with the test for molecular-mass distribution (see Tests).

TESTS

Solution S. Dissolve 7.5 g in *carbon dioxide-free water R*, heat on a water-bath and dilute to 50 ml with the same solvent.

Absorbance (2.2.25). Measure the absorbance of solution S at 375 nm. The absorbance is not more than 0.12.

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of 0.01 M *sodium hydroxide*. The solution is pink. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is colourless. Add 0.1 ml of *methyl red solution R*. The solution is red or orange.

Nitrogen-containing substances. Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 0.200 g and heating for 2 h. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution R*, 0.5 ml of *methyl red solution R* and 20 ml of *water R*. Titrate with 0.01 M *hydrochloric acid*. Not more than 0.15 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator (110 ppm N).

Sodium chloride. Not more than 1.5 per cent. Accurately weigh 3.5 g and dissolve in 100 ml of *water R*. Add 0.3 ml of *potassium chromate solution R* and titrate with 0.1 M *silver nitrate* until the yellowish-white colour changes to reddish-brown.

1 ml of 0.1 M *silver nitrate* is equivalent to 5.844 mg of NaCl.

Molecular-mass distribution. The average molecular mass (M_w) is 850 to 1150. The fraction with less than 3 units of glucose is less than 15 per cent, the fraction with more than 9 units of glucose is less than 20 per cent.

Examine by size-exclusion chromatography (2.2.30).

Test solution. Dissolve 6.0-6.5 mg of the substance to be examined in 1.0 ml of the mobile phase.

Reference solution (a). Dissolve 6.0-6.5 mg of *dextran 1 CRS* in 1.0 ml of the mobile phase.

Reference solution (b). Dissolve the content of an ampoule of *isomaltooligosaccharide CRS* in 1 ml of the mobile phase, and mix. This corresponds to approximately 45 µg of isomaltotriose (3 glucose units), approximately 45 µg of isomaltotetraose (4 glucose units), and approximately 60 µg of isomaltopentaose (5 glucose units).

The chromatographic procedure may be carried out using:

- 2 columns, 30 cm long and 10 mm in internal diameter, in series, prepacked with a packing material of dextran covalently bound to highly cross-linked porous agarose beads, allowing resolution of oligosaccharides in the molecular mass range of 180 to 3000, kept at a temperature of 20-25 °C,
- as mobile phase at a flow rate of 0.07-0.08 ml/min maintained constant to ± 1 per cent, a 2.92 g/l solution of *sodium chloride R*,
- as detector a differential refractometer.

Inject 100 µl of reference solution (b) and record the chromatogram for definition of the positions of isomaltotriose, isomaltotetraose and sodium chloride. Inject 100 µl of the test solution and 100 µl of reference solution (a) and record the chromatograms. Determine the peak areas. Disregard any peak due to sodium chloride.

Calculate the average relative molecular mass M_w and the amount of the fraction with less than 3 and more than 9 glucose units, of *dextran 1 CRS* and of the substance to be examined. The test is not valid unless the values obtained for *dextran 1 CRS* are within the values stated on the label.

$$M_w = \sum w_i \times m_i$$

M_w = average molecular mass of the dextran,

m_i = molecular mass of oligosaccharide i ,

w_i = weight proportion of oligosaccharide i .

Use the following molecular mass values for the calculation:

Oligosaccharide i	m_i
glucose	180
isomaltose	342
isomaltotriose	504
isomaltotetraose	666
isomaltopentaose	828
isomaltohexaose	990
isomaltoheptaose	1152
isomaltooctaose	1314
isomaltotonaose	1476
isomaltodecaose	1638
isomaltoundecaose	1800
isomaltododecaose	1962
isomaltotridecaose	2124
isomaltotetradecaose	2286
isomaltopentadecaose	2448
isomaltohexadecaose	2610
isomaltoheptadecaose	2772
isomaltooctadecaose	2934
isomaltotonaadecaose	3096

Heavy metals (2.4.8). Dilute 20 ml of solution S to 30 ml with *water R*. 12 ml of this solution complies with limit test A (10 ppm). Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 5.000 g by drying in an oven at 100-105 °C for 5 h.

Bacterial endotoxins (2.6.14): less than 25 IU/g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:0999

DEXTRAN 40 FOR INJECTION

Dextranum 40 ad iniectabile

DEFINITION

Dextran 40 for injection is a mixture of polysaccharides, principally of the α-1,6-glucan type.

The average relative molecular mass is about 40 000.

PRODUCTION

It is obtained by hydrolysis and fractionation of dextrans produced by fermentation of sucrose using *Leuconostoc mesenteroides* strain NRRL B-512 = CIP 78.59 or substrains thereof (for example *L. mesenteroides* B-512F = NCTC 10817).

It is prepared in conditions designed to minimise the risk of microbial contamination.

CHARACTERS

A white or almost white powder, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 1.0 g in *water R*, heating on a water-bath, and dilute to 50.0 ml with the same solvent. The specific optical rotation (2.2.7) of the solution is + 195 to + 201, calculated with reference to the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dextran CRS*.
- C. It complies with the test for molecular-mass distribution (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R*, heating on a water-bath, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution remains colourless. Add 0.2 ml of 0.01 M *sodium hydroxide*. The solution is red. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is colourless. Add 0.1 ml of *methyl red solution R*. The solution is red or orange.

Nitrogen-containing substances. Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 0.200 g and heating for 2 h. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution R*, 0.5 ml of *methyl red solution R* and 20 ml of *water R*. Titrate with 0.01 M *hydrochloric acid*. Not more than 0.15 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator (110 ppm N).

Residual solvents. Examine by gas chromatography (2.2.28), using *propanol R* as internal standard.

Test solution. Dissolve 5 g of the substance to be examined in 100 ml of *water R* and distil. Collect the first 45 ml of the distillate, add 1 ml of a 25 g/l solution of *propanol R* and dilute to 50 ml with *water R*.

Reference solution. Mix 0.5 ml of a 25 g/l solution of *ethanol R*, 0.5 ml of a 25 g/l solution of *propanol R* and 0.5 ml of a 2.5 g/l solution of *methanol R* and dilute to 25.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 1.8 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (125–150 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 25 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 190 °C, that of the injection port at 240 °C and that of the detector at 210 °C. Inject the chosen volume of each solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ethanol or methanol is not greater than the area of the corresponding peak in the

chromatogram obtained with the reference solution (0.5 per cent of ethanol and 0.05 per cent of methanol) and the sum of the areas of any peaks, apart from the peaks corresponding to ethanol, methanol and the internal standard, is not greater than the area of the peak corresponding to the internal standard (0.5 per cent calculated as propanol).

Molecular-mass distribution (2.2.39). The average molecular mass (M_w) is 35 000 to 45 000. The average molecular mass of the 10 per cent high fraction is not more than 110 000. The average molecular mass of the 10 per cent low fraction is not less than 7000.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 0.200 g by heating in an oven at 105 ± 2 °C for 5 h.

Sulphated ash (2.4.14). Not more than 0.3 per cent, determined on 0.50 g.

Bacterial endotoxins (2.6.14): less than 10 IU/g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:1000

DEXTRAN 60 FOR INJECTION

Dextranum 60 ad iniectionabile

DEFINITION

Dextran 60 for injection is a mixture of polysaccharides, principally of the α-1,6-glucan type.

The average relative molecular mass is about 60 000.

PRODUCTION

It is obtained by hydrolysis and fractionation of dextrans produced by fermentation of sucrose using *Leuconostoc mesenteroides* strain NRRL B-512 = CIP 78.59 or substrains thereof (for example *L. mesenteroides* B-512F = NCTC 10817).

It is prepared in conditions designed to minimise the risk of microbial contamination.

CHARACTERS

A white or almost white powder, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 1.0 g in *water R*, heating on a water-bath, and dilute to 50.0 ml with the same solvent. The specific optical rotation (2.2.7) of the solution is + 195 to + 201, calculated with reference to the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dextran CRS*.
- C. It complies with the test for molecular-mass distribution (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R*, heating on a water-bath, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

01/2005:1001

DEXTRAN 70 FOR INJECTION

Dextranum 70 ad iniectabile

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution remains colourless. Add 0.2 ml of 0.01 M sodium hydroxide. The solution is red. Add 0.4 ml of 0.01 M hydrochloric acid. The solution is colourless. Add 0.1 ml of *methyl red solution R*. The solution is red or orange.

Nitrogen-containing substances. Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 0.200 g and heating for 2 h. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution R*, 0.5 ml of *methyl red solution R* and 20 ml of *water R*. Titrate with 0.01 M hydrochloric acid. Not more than 0.15 ml of 0.01 M hydrochloric acid is required to change the colour of the indicator (110 ppm N).

Residual solvents. Examine by gas chromatography (2.2.28), using *propanol R* as internal standard.

Test solution. Dissolve 5 g of the substance to be examined in 100 ml of *water R* and distil. Collect the first 45 ml of the distillate, add 1 ml of a 25 g/l solution of *propanol R* and dilute to 50 ml with *water R*.

Reference solution. Mix 0.5 ml of a 25 g/l solution of *ethanol R*, 0.5 ml of a 25 g/l solution of *propanol R* and 0.5 ml of a 2.5 g/l solution of *methanol R* and dilute to 25.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 1.8 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (125-150 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 25 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 190 °C, that of the injection port at 240 °C and that of the detector at 210 °C. Inject the chosen volume of each solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ethanol or methanol is not greater than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent of ethanol and 0.05 per cent of methanol) and the sum of the areas of any peaks, apart from the peaks corresponding to ethanol, methanol and the internal standard, is not greater than the area of the peak corresponding to the internal standard (0.5 per cent calculated as propanol).

Molecular-mass distribution (2.2.39). The average molecular mass (M_w) is 54 000 to 66 000. The average molecular mass of the 10 per cent high fraction is not more than 180 000. The average molecular mass of the 10 per cent low fraction is not less than 14 000.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 0.200 g by heating in an oven at 105 ± 2 °C for 5 h.

Sulphated ash (2.4.14). Not more than 0.3 per cent, determined on 0.50 g.

Bacterial endotoxins (2.6.14): less than 16 IU/g.

Microbial contamination. Total viable count (2.6.12) not more than 10^2 micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (2.6.13).

DEFINITION

Dextran 70 for injection is a mixture of polysaccharides, principally of the α -1,6-glucan type.

The average relative molecular mass is about 70 000.

PRODUCTION

It is obtained by hydrolysis and fractionation of dextrans produced by fermentation of sucrose using *Leuconostoc mesenteroides* strain NRRL B-512 = CIP 78.59 or substrains thereof (for example *L. mesenteroides* B-512F = NCTC 10817).

It is prepared in conditions designed to minimise the risk of microbial contamination.

CHARACTERS

A white or almost white powder, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 1.0 g in *water R*, heating on a water-bath, and dilute to 50.0 ml with the same solvent. The specific optical rotation (2.2.7) of the solution is + 195 to + 201, calculated with reference to the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dextran CRS*.
- C. It complies with the test for molecular-mass distribution (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R*, heating on a water-bath, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution remains colourless. Add 0.2 ml of 0.01 M sodium hydroxide. The solution is red. Add 0.4 ml of 0.01 M hydrochloric acid. The solution is colourless. Add 0.1 ml of *methyl red solution R*. The solution is red or orange.

Nitrogen-containing substances. Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 0.200 g and heating for 2 h. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution R*, 0.5 ml of *methyl red solution R* and 20 ml of *water R*. Titrate with 0.01 M hydrochloric acid. Not more than 0.15 ml of 0.01 M hydrochloric acid is required to change the colour of the indicator (110 ppm N).

Residual solvents. Examine by gas chromatography (2.2.28), using *propanol R* as internal standard.

Test solution. Dissolve 5 g of the substance to be examined in 100 ml of *water R* and distil. Collect the first 45 ml of the distillate, add 1 ml of a 25 g/l solution of *propanol R* and dilute to 50 ml with *water R*.

Reference solution. Mix 0.5 ml of a 25 g/l solution of *ethanol R*, 0.5 ml of a 25 g/l solution of *propanol R* and 0.5 ml of a 2.5 g/l solution of *methanol R* and dilute to 25.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 1.8 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (125–150 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 25 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 190 °C, that of the injection port at 240 °C and that of the detector at 210 °C. Inject the chosen volume of each solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ethanol or methanol is not greater than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent of ethanol and 0.05 per cent of methanol) and the sum of the areas of any peaks, apart from the peaks corresponding to ethanol, methanol and the internal standard, is not greater than the area of the peak corresponding to the internal standard (0.5 per cent calculated as propanol).

Molecular-mass distribution (2.2.39). The average molecular mass (M_w) is 64 000 to 76 000. The average molecular mass of the 10 per cent high fraction is not more than 185 000. The average molecular mass of the 10 per cent low fraction is not less than 15 000.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 0.200 g by heating in an oven at 105 ± 2 °C for 5 h.

Sulphated ash (2.4.14). Not more than 0.3 per cent, determined on 0.50 g.

Bacterial endotoxins (2.6.14): less than 16 IU/g.

Microbial contamination. Total viable count (2.6.12) not more than 10^2 micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (2.6.13).

TESTS

pH (2.2.3). Disperse 5.0 g in 100 ml of *carbon dioxide-free water R*. The pH is 2.0 to 8.0.

Chlorides. Dissolve 2.5 g in 50 ml of boiling *water R*, dilute to 100 ml with *water R* and filter. Dilute 1 ml of the filtrate to 15 ml, add 1 ml of *dilute nitric acid R*, pour the mixture as a single addition into 1 ml of *silver nitrate solution R2* and allow to stand for 5 min protected from light. When viewed transversely against a black background any opalescence produced is not more intense than that obtained by treating a mixture of 10 ml of *chloride standard solution (5 ppm Cl) R* and 5 ml of *water R*, prepared in the same manner (0.2 per cent).

Reducing sugars. To a quantity of dextrin equivalent to 2.0 g (dried substance) add 100 ml of *water R*, shake for 30 min, dilute with *water R* to 200.0 ml and filter. To 10.0 ml of alkaline *cupri-tartaric solution R* add 20.0 ml of the filtrate, mix, and heat on a hot plate adjusted to bring the solution to boil within 3 min. Boil for 2 min, and cool immediately. Add 5 ml of a 300 g/l solution of *potassium iodide R* and 10 ml of *1 M sulphuric acid*, mix, and titrate immediately with *0.1 M sodium thiosulphate*, using *starch solution R*, added towards the end of the titration, as indicator. Repeat the procedure beginning with “To 10.0 ml of...”, using, in place of the filtrate, 20.0 ml of a 1 g/l solution of *glucose R*, accurately prepared. Perform a blank titration. ($V_B - V_U$) is not greater than ($V_B - V_S$), in which V_B , V_U and V_S are the number of millilitres of *0.1 M sodium thiosulphate* consumed in the titrations of the blank, the dextrin and the glucose, respectively (10 per cent, calculated as glucose $C_6H_{12}O_6$).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 13.0 per cent, determined on 1.000 g by drying at 130 °C to 135 °C for 90 min.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

01/2005:1507

DEXTRIN

Dextrinum

DEFINITION

Dextrin is maize, potato or cassava starch partly hydrolysed and modified by heating with or without the presence of acids, alkalis or pH control agents.

CHARACTERS

White or almost white, free-flowing powder, very soluble in boiling water forming a mucilaginous solution, slowly soluble in cold water, practically insoluble in alcohol.

IDENTIFICATION

- Suspend 1 g in 50 ml of *water R*, boil for 1 min and cool. To 1 ml of the solution add 0.05 ml of *iodine solution R1*. A dark blue to reddish-brown colour is produced which disappears on heating.
- Centrifuge 5 ml of the mucilage obtained in identification test A. To the upper layer add 2 ml of *dilute sodium hydroxide solution R* and, dropwise with shaking, 0.5 ml of *copper sulphate solution R* and boil. A red precipitate is produced.
- It is very soluble in boiling *water R*, forming a mucilaginous solution.

01/2005:0020

DEXTROMETHORPHAN HYDROBROMIDE

Dextromethorphan hydrobromidum

 $C_{18}H_{26}BrNO \cdot H_2O$
 M_r 370.3

DEFINITION

ent-3-Methoxy-17-methylmorphinan hydrobromide monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: almost white, crystalline powder.

Solubility: sparingly soluble in water, freely soluble in alcohol.

mp: about 125 °C, with decomposition.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: dextromethorphan hydrobromide CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 25 mg of *dextromethorphan hydrobromide CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate *R*.

Mobile phase: concentrated ammonia *R*, methylene chloride *R*, methanol *R*, ethyl acetate *R*, toluene *R* (2:10:13:20:55 V/V/V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *potassium iodobismuthate solution R2*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of bromides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *alcohol R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.4 g in *carbon dioxide-free water R* with gentle heating, cool and dilute to 20 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Specific optical rotation (2.2.7). + 28 to + 30 (anhydrous substance).

Dissolve 0.200 g in 0.1 M *hydrochloric acid* and dilute to 10.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *dextromethorphan impurity A CRS* in 2 ml of the test solution and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Column:

– **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,

– **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: dissolve 3.11 g of *docusate sodium R* in a mixture of 400 ml of *water R* and 600 ml of *acetonitrile R*. Add 0.56 g of *ammonium nitrate R*. Adjust to apparent pH 2.0 with *glacial acetic acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Run time: twice the retention time of dextromethorphan.

Relative retention with reference to dextromethorphan (retention time = about 21.9 min): impurity B = about 0.44; impurity C = about 0.85; impurity D = about 0.90; impurity A = about 1.13.

System suitability: reference solution (a):

– **resolution:** minimum 1.5 between the peaks due to impurity A and dextromethorphan.

Limits:

– **correction factor:** for the calculation of content, multiply the peak area of impurity C by 0.2,

– **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), and not more than 1 such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),

– **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),

– **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

N,N-Dimethylaniline: maximum 10 ppm.

Dissolve 0.5 g with heating in 20 ml of *water R*. Allow to cool, add 2 ml of *dilute acetic acid R* and 1 ml of a 10 g/l solution of *sodium nitrite R* and dilute to 25 ml with *water R*. The solution is not more intensely coloured than a reference solution prepared at the same time in the same manner using 20 ml of a 0.25 mg/l solution of *dimethylaniline R*.

Water (2.5.12): 4.0 per cent to 5.5 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 20 ml of *alcohol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 35.23 mg of $C_{18}H_{26}BrNO$.

STORAGE

Protected from light.

IMPURITIES

- A. R1 = CH₃, R2 = H, X = H₂: *ent*-3-methoxymorphinan,
 B. R1 = H, R2 = CH₃, X = H₂: *ent*-17-methylmorphinan-3-ol,
 C. R1 = R2 = CH₃, X = O: *ent*-3-methoxy-17-methylmorphinan-10-one,

- D. *ent*-(14*S*)-3-methoxy-17-methylmorphinan.

01/2005:0021

DEXTROMORAMIDE TARTRATE

Dextromoramidi tartras

C₂₉H₃₈N₂O₈M_r 542.6

DEFINITION

Dextromoramide tartrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1-[(3*S*)-3-methyl-4-(morpholin-4-yl)-2,2-diphenylbutanoyl]pyrrolidine hydrogen (2*R*,3*R*)-2,3-dihydroxybutanedioate, calculated with reference to the dried substance.

CHARACTERS

A white, amorphous or crystalline powder, soluble in water, sparingly soluble in alcohol.

It melts at about 190 °C, with slight decomposition.

IDENTIFICATION

- A. Dissolve 75 mg in 1 M hydrochloric acid and dilute to 100.0 ml with the same acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows 3 absorption maxima, at 254 nm, 259 nm and 264 nm. The specific absorbances at the maxima are about 6.9, 7.7 and 6.5, respectively.
 B. Dissolve about 50 mg in water *R* and dilute to 10 ml with the same solvent. To 2 ml of the solution add 3 ml of ammoniacal silver nitrate solution *R* and heat on a water-bath. A grey or black precipitate is formed.

C. It gives reaction (b) of tartrates (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.2 g in carbon dioxide-free water *R* and dilute to 20 ml with the same solvent. The pH of the solution is 3.0 to 4.0.

Specific optical rotation (2.2.7). Dissolve 0.50 g in 0.1 M hydrochloric acid and dilute to 10.0 ml with the same acid. The specific optical rotation is + 21 to + 23.

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel *G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 1 ml of the test solution to 100 ml with methanol *R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using methanol *R*. Allow the plate to dry in air and spray with dilute potassium iodobismuthate solution *R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 30 ml of anhydrous acetic acid *R*. Titrate with 0.05 M perchloric acid using 0.15 ml of naphtholbenzein solution *R* as indicator.

1 ml of 0.05 M perchloric acid is equivalent to 27.13 mg of C₂₉H₃₈N₂O₈.

01/2005:0713

DEXTROPROPOXYPHENE HYDROCHLORIDE

Dextropropoxypheni hydrochloridum

C₂₂H₃₀ClNO₂M_r 375.9

DEFINITION

Dextropropoxyphene hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (1*S*,2*R*)-1-benzyl-3-(dimethylamino)-2-methyl-1-phenylpropyl propanoate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, freely soluble in alcohol.

It melts at about 165 °C.

IDENTIFICATION

First identification: A, C, D.

Second identification: A, B, D.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Dissolve 50.0 mg in 0.01 M hydrochloric acid and dilute to 100.0 ml with the same acid. Examined between 220 nm and 360 nm (2.2.25), the solution shows 3 absorption maxima, at 252 nm, 257 nm and 263 nm and 2 shoulders, at 240 nm and 246 nm. The ratio of the absorbance at the maximum at 257 nm to that at the maximum at 252 nm is 1.22 to 1.28. The ratio of the absorbance at the maximum at 257 nm to that at the maximum at 263 nm is 1.29 to 1.35. The test is not valid unless, in the test for resolution (2.2.25), the ratio of the absorbances is at least 1.5.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of dextropropoxyphene hydrochloride*.
- D. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.5 g in carbon dioxide-free water R and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. Dilute 10 ml of solution S to 25 ml with carbon dioxide-free water R. To 10 ml of this solution, add 0.1 ml of methyl red solution R and 0.2 ml of 0.01 M sodium hydroxide. The solution is yellow. Add 0.4 ml of 0.01 M hydrochloric acid. The solution is red.

Specific optical rotation (2.2.7). Dissolve 0.100 g in water R and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 52 to + 57.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 0.50 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 50.0 mg of the substance to be examined in 2.5 ml of 2 M alcoholic potassium hydroxide. Add 2.5 ml of water R and boil under a reflux condenser for 30 min. Add 2.5 ml of dilute hydrochloric acid R and dilute to 50 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.125 m long and 4.6 mm in internal diameter packed with silica gel for chromatography R (5 µm),
- a guard column packed with a suitable silica gel, equilibrated with the mobile phase and placed between the column and the injection device,
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 50 volumes of 0.2 M phosphate buffer solution pH 7.5 R, 84 volumes of tetrahydrofuran R, 350 volumes of methanol R and 516 volumes of water R, containing 0.9 g/l of cetyltrimethylammonium bromide R,
- as detector a spectrophotometer set at 220 nm,
- a loop injector.

Equilibrate the chromatographic system by passage of the mobile phase for 16 h (the mobile phase may be recirculated after 6 h).

Inject 20 µl of each solution and record the chromatograms for twice the retention time of the principal peak. The test is not valid unless:

- the chromatogram obtained with reference solution (a) shows a peak with a signal-to-noise ratio of at least 5,
- the chromatogram obtained with reference solution (b) shows 2 peaks with a resolution of not less than 2.0.

In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (20 ppm). Prepare the standard using lead standard solution (1 ppm Pb) R.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.270 g in 60 ml of acetic anhydride R. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 37.59 mg of C₂₂H₃₀ClNO₂.

STORAGE

Protected from light.

IMPURITIES

- A. R = H: (2S,3R)-4-(dimethylamino)-1,2-diphenyl-3-methylbutan-2-ol,
- B. R = CO-CH₃: (1S,2R)-1-benzyl-3-(dimethylamino)-2-methyl-1-phenylpropyl acetate.

01/2005:0022

DIAZEPAM

Diazepamum

C₁₆H₁₃ClN₂OM_r 284.7

DEFINITION

Diazepam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 7-chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, soluble in alcohol.

IDENTIFICATION

- A. Melting point (2.2.14): 131 °C to 135 °C.
- B. *Protect the solutions from bright light and measure the absorbances immediately.* Dissolve 25 mg in a 5 g/l solution of *sulphuric acid R* in *methanol R* and dilute to 250.0 ml with the same acid solution (solution A). Dilute 5.0 ml of solution A to 100.0 ml with a 5 g/l solution of *sulphuric acid R* in *methanol R*. Examined between 230 nm and 330 nm (2.2.25), the solution shows 2 absorption maxima, at 242 nm and 285 nm. The specific absorbance at the maximum at 242 nm is about 1020. Dilute 25.0 ml of solution A to 100.0 ml with a 5 g/l solution of *sulphuric acid R* in *methanol R*. Examined between 325 nm and 400 nm, the solution shows a single absorption maximum at 366 nm. The specific absorbance at the maximum is 140 to 155.
- C. Dissolve about 10 mg in 3 ml of *sulphuric acid R*. The solution shows greenish-yellow fluorescence in ultraviolet light at 365 nm.
- D. To 80 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Related substances and decomposition products. Carry out the test protected from bright light. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 100 ml with *acetone R*. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of equal volumes of *ethyl acetate R* and *hexane R*. Allow the plate to dry and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 4 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C *in vacuo* for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 50 ml of *acetic anhydride R*. Using 0.3 ml of *Nile blue A solution R* as indicator, titrate with 0.1 M *perchloric acid* until a yellowish-green colour is obtained.

1 ml of 0.1 M *perchloric acid* is equivalent to 28.47 mg of C₁₆H₁₃ClN₂O.

STORAGE

Store protected from light.

01/2005:0550

DIAZOXIDE

Diazoxidum

C₈H₇ClN₂O₂SM_r 230.7

DEFINITION

Diazoxide contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 7-chloro-3-methyl-2H-1,2,4-benzothiadiazine 1,1-dioxide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, fine or crystalline powder, practically insoluble in water, freely soluble in dimethylformamide, slightly soluble in alcohol. It is very soluble in dilute solutions of the alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Dissolve 50.0 mg in 5 ml of 1 M *sodium hydroxide* and dilute to 50.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with 0.1 M *sodium hydroxide*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 280 nm and a shoulder at 304 nm. The specific absorbance at the maximum is 570 to 610.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diazoxide CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).
- D. Dissolve about 20 mg in a mixture of 5 ml of *hydrochloric acid R* and 10 ml of *water R*. Add 0.1 g of *zinc powder R*. Boil for 5 min, cool and filter. To the filtrate add 2 ml of a 1 g/l solution of *sodium nitrite R* and mix. Allow to stand for 1 min and add 1 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. A red or violet-red colour develops.

TESTS

Appearance of solution. Dissolve 0.4 g in 2 ml of 1 M *sodium hydroxide* and dilute to 20 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Acidity or alkalinity. To 0.5 g of the powdered substance to be examined add 30 ml of *carbon dioxide-free water R*, shake for 2 min and filter. To 10 ml of the filtrate add 0.2 ml of 0.01 M *sodium hydroxide* and 0.15 ml of *methyl red*

solution R. The solution is yellow. Not more than 0.4 ml of 0.01 M hydrochloric acid is required to change the colour of the indicator to red.

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ R as the coating substance.

Test solution (a). Dissolve 0.1 g of the substance to be examined in a mixture of 0.5 ml of 1 M sodium hydroxide and 1 ml of methanol R and dilute to 5 ml with methanol R.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 1 volume of 1 M sodium hydroxide and 9 volumes of methanol R.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with a mixture of 1 volume of 1 M sodium hydroxide and 9 volumes of methanol R.

Reference solution (b). Dissolve 20 mg of diazoxide CRS in a mixture of 0.5 ml of 1 M sodium hydroxide and 1 ml of methanol R and dilute to 5 ml with methanol R.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 7 volumes of concentrated ammonia R, 25 volumes of methanol R and 68 volumes of chloroform R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g with gentle heating in 50 ml of a mixture of 1 volume of water R and 2 volumes of dimethylformamide R. Titrate with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M sodium hydroxide is equivalent to 23.07 mg of C₈H₇ClN₂O₂S.

01/2005:0762

DIBUTYL PHTHALATE

Dibutylis phthalas

C₁₆H₂₂O₄

M_r 278.3

DEFINITION

Dibutyl phthalate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent m/m of dibutyl benzene-1,2-dicarboxylate.

CHARACTERS

A clear, oily liquid, colourless or very slightly yellow, practically insoluble in water, miscible with alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, D, E.

A. Relative density (2.2.5): 1.043 to 1.048.

B. Refractive index (2.2.6): 1.490 to 1.495.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with dibutyl phthalate CRS.

D. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ R as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in ether R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of dibutyl phthalate CRS in ether R and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of heptane R and 70 volumes of ether R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

E. To about 0.1 ml add 0.25 ml of sulphuric acid R and 50 mg of resorcinol R. Heat in a water-bath for 5 min. Allow to cool. Add 10 ml of water R and 1 ml of strong sodium hydroxide solution R. The solution becomes yellow or brownish-yellow and shows a green fluorescence.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Acidity. Dissolve 20.0 g in 50 ml of alcohol R previously neutralised to phenolphthalein solution R1. Add 0.2 ml of phenolphthalein solution R1. Not more than 0.50 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Related substances. Examine by gas chromatography (2.2.28), using bibenzyl R as internal standard.

Internal standard solution. Dissolve 60 mg of bibenzyl R in methylene chloride R and dilute to 20 ml with the same solvent.

Test solution (a). Dissolve 1.0 g of the substance to be examined in methylene chloride R and dilute to 20.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in methylene chloride R, add 2.0 ml of the internal standard solution and dilute to 20.0 ml with methylene chloride R.

Reference solution. To 1.0 ml of test solution (a) add 10.0 ml of the internal standard solution and dilute to 100.0 ml with methylene chloride R.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m long and 4 mm in internal diameter, packed with silanised diatomaceous earth for gas chromatography R (150 µm to 180 µm) impregnated with 3 per cent m/m of polymethylphenylsiloxane R,
- nitrogen for chromatography R as the carrier gas at a flow rate of 30 ml per minute,
- a flame-ionisation detector,

maintaining the temperature of the column at 190 °C and that of the injection port and of the detector at 225 °C.

Inject 1 µl of the reference solution. The substances elute in the following order: bibenzyl and dibutyl phthalate. Adjust the sensitivity of the detector so that the height of the bibenzyl peak is not less than 70 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to bibenzyl and dibutyl phthalate is at least 12.

Inject 1 µl of test solution (a). In the chromatogram obtained, verify that there is no peak with the same retention time as the internal standard.

Inject separately 1 µl of test solution (b) and the reference solution. Continue the chromatography for 3 times the retention time of dibutyl phthalate, which is about 12 min. From the chromatogram obtained with the reference solution, calculate the ratio (*R*) of the area of the peak due to dibutyl phthalate to the area of the peak due to the internal standard. From the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of any peaks, apart from the principal peak, the peak due to the internal standard and the peak due to the solvent, to the area of the peak due to the internal standard: this ratio is not greater than *R* (1.0 per cent).

Water (2.5.12). Not more than 0.2 per cent, determined on 10.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Introduce 0.750 g into a 250 ml borosilicate glass flask. Add 25.0 ml of 0.5 *M* alcoholic potassium hydroxide and a few glass beads. Heat in a water-bath under a reflux condenser for 1 h. Add 1 ml of phenolphthalein solution R1 and titrate immediately with 0.5 *M* hydrochloric acid until the colour changes from red to colourless. Carry out a blank titration. Calculate the volume of potassium hydroxide used in the saponification.

1 ml of 0.5 *M* alcoholic potassium hydroxide is equivalent to 69.59 mg of C₁₆H₂₂O₄.

STORAGE

Store in an airtight container.

01/2005:1718

DICLAZURIL FOR VETERINARY USE

Diclazurilum ad usum veterinarium

C₁₇H₉Cl₃N₄O₂

M_r 407.6

DEFINITION

(*RS*)-(4-Chlorophenyl)[2,6-dichloro-4-(3,5-dioxo-4,5-dihydro-1,2,4-triazin-2(3*H*)-yl)phenyl]acetone nitrile.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or light yellow powder.

Solubility: practically insoluble in water, sparingly soluble in dimethylformamide, practically insoluble in alcohol and methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of diclazuril.*

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in dimethylformamide *R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of diclazuril for system suitability CRS in dimethylformamide *R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with dimethylformamide *R*. Dilute 5.0 ml of the solution to 20.0 ml with dimethylformamide *R*.

Column:

- **size:** *l* = 0.10 m, Ø = 4.6 mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography *R* (3 µm),
- **temperature:** 35 °C.

Mobile phase:

- **mobile phase A:** mix 10 volumes of a 6.3 g/l solution of ammonium formate *R* adjusted to pH 4.0 with anhydrous formic acid *R*, 15 volumes of acetonitrile *R* and 75 volumes of water *R*,
- **mobile phase B:** mix 10 volumes of a 6.3 g/l solution of ammonium formate *R* adjusted to pH 4.0 with anhydrous formic acid *R*, 85 volumes of acetonitrile *R* and 5 volumes of water *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 0	0 → 100
20 - 25	0	100
25 - 26	0 → 100	100 → 0
26 - 36	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 5 µl.

System suitability: reference solution (a):

- **peak-to-valley ratio:** minimum of 1.5, where *H_p* = height above the baseline of the peak due to impurity D and *H_v* = height above the baseline of the lowest point of the curve separating this peak from the peak due to diclazuril.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 1.9; impurity H = 1.4,
- **impurity D:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- **total:** not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 75 ml of *dimethylformamide R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *tetrabutylammonium hydroxide*. Read the volume added at the second inflexion point. Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 20.38 mg of $C_{17}H_{13}Cl_2N_4O_2$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.

- A. R = Cl, R' = CO₂H: 2-[3,5-dichloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]phenyl]-3,5-dioxo-2,3,4,5-tetrahydro-1,2,4-triazine-6-carboxylic acid,
- B. R = OH, R' = H: (*RS*)-[2,6-dichloro-4-(3,5-dioxo-4,5-dihydro-1,2,4-triazin-2(3*H*)-yl)phenyl](4-hydroxyphenyl)acetoneitrile,
- C. R = Cl, R' = CONH₂: 2-[3,5-dichloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]phenyl]-3,5-dioxo-2,3,4,5-tetrahydro-1,2,4-triazine-6-carboxamide,
- G. R = Cl, R' = CO-O-[CH₂]₃-CH₃: butyl 2-[3,5-dichloro-4-[(*RS*)-(4-chlorophenyl)cyanomethyl]phenyl]-3,5-dioxo-2,3,4,5-tetrahydro-1,2,4-triazine-6-carboxylate,

- D. X = O: 2-[3,5-dichloro-4-(4-chlorobenzoyl)phenyl]-1,2,4-triazine-3,5-(2*H*,4*H*)-dione,
- F. X = H₂: 2-[3,5-dichloro-4-(4-chlorobenzyl)phenyl]-1,2,4-triazine-3,5-(2*H*,4*H*)-dione,

- E. R = NH₂: (*RS*)-(4-amino-2,6-dichlorophenyl)-(4-chlorophenyl)acetoneitrile,
- H. R = H: (*RS*)-(4-chlorophenyl)-(2,6-dichlorophenyl)acetoneitrile,

- I. *N*,2-bis[3,5-dichloro-4-[(4-chlorophenyl)cyanomethyl]phenyl]-3,5-dioxo-2,3,4,5-tetrahydro-1,2,4-triazine-6-carboxamide.

01/2005:1508

DICLOFENAC POTASSIUM

Diclofenacum kalicum

$C_{14}H_{10}Cl_2KNO_2$

M_r 334.2

DEFINITION

Potassium diclofenac contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of potassium [2-[(2,6-dichlorophenyl)amino]phenyl]acetate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, slightly hygroscopic, sparingly soluble in water, freely soluble in methanol, soluble in alcohol, slightly soluble in acetone.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diclofenac potassium CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *diclofenac potassium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *indometacin R* in reference solution (a) and dilute to 2 ml with the same solution.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 10 volumes of *methanol R* and 80 volumes of *ethyl acetate R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the

chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Dissolve about 10 mg in 10 ml of *alcohol R*. To 1 ml of the solution add 0.2 ml of a mixture, prepared immediately before use, of equal volumes of a 6 g/l solution of *potassium ferricyanide R* and a 9 g/l solution of *ferric chloride R*. Allow to stand protected from light for 5 min. Add 3 ml of a 10 g/l solution of *hydrochloric acid R*. Allow to stand protected from light for 15 min. A blue colour develops and a precipitate is formed.
- D. Suspend 0.5 g of the substance to be examined in 10 ml of *water R*. Stir, add *water R* until the substance is dissolved. Add 2 ml of *hydrochloric acid R1*, stir for 1 h and filter with the aid of vacuum. Neutralise the solution with *sodium hydroxide solution R*. The solution gives reaction (b) of potassium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.25 g in *methanol R* and dilute to 25.0 ml with the same solvent. The solution is clear (2.2.1). The absorbance (2.2.25) measured at 440 nm is not greater than 0.05.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol R*.

Reference solution (b). Dissolve 1.0 mg of *diclofenac impurity A CRS* in *methanol R*, add 1.0 ml of the test solution and dilute to 200.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *end-capped octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 34 volumes of a solution containing 0.5 g/l of *phosphoric acid R* and 0.8 g/l of *sodium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R*, and 66 volumes of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). When the chromatograms are recorded in the prescribed conditions, the retention times are: diclofenac, about 25 min and impurity A, about 12 min. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained the resolution between the peaks corresponding to diclofenac and impurity A is not less than 6.5.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for 1.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.5 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 2.0 g complies with limit test C (10 ppm). Use a quartz crucible. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

ASSAY

Dissolve 0.250 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 33.42 mg of C₁₄H₁₀Cl₂KNO₂.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. 1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one,

- B. R1 = CHO, R2 = Cl: 2-[(2,6-dichlorophenyl)amino]benzaldehyde,
- C. R1 = CH₂OH, R2 = Cl: [2-[(2,6-dichlorophenyl)amino]phenyl]methanol,
- D. R1 = CH₂-CO₂H, R2 = Br: 2-[2-[(2-bromo-6-chlorophenyl)amino]phenyl]acetic acid,

- E. 1,3-dihydro-2H-indol-2-one.

01/2005:1002

DICLOFENAC SODIUM

Diclofenacum natricum

C₁₄H₁₀Cl₂NNaO₂

M_r 318.1

DEFINITION

Diclofenac sodium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of sodium 2-[(2,6-dichlorophenyl)amino]phenyl]acetate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, slightly hygroscopic, sparingly soluble in water, freely soluble in methanol, soluble in alcohol, slightly soluble in acetone.

It melts at about 280 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diclofenac sodium CRS*. Examine the substances prepared as discs.

B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *diclofenac sodium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *indometacin R* in reference solution (a) and dilute to 2 ml with the same solution.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 10 volumes of *methanol R* and 80 volumes of *ethyl acetate R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

C. Dissolve about 10 mg in 10 ml of *alcohol R*. To 1 ml of the solution add 0.2 ml of a mixture, prepared immediately before use, of equal volumes of a 6 g/l solution of *potassium ferricyanide R* and a 9 g/l solution of *ferric chloride R*. Allow to stand protected from light for 5 min. Add 3 ml of a 10 g/l solution of *hydrochloric acid R*. Allow to stand, protected from light, for 15 min. A blue colour develops and a precipitate is formed.

D. Dissolve 60 mg in 0.5 ml of *methanol R* and add 0.5 ml of *water R*. The solution gives reaction (b) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.25 g in *methanol R* and dilute to 25.0 ml with the same solvent. The solution is clear (2.2.1). The absorbance (2.2.25) measured at 440 nm is not greater than 0.05.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol R*.

Reference solution (b). Dissolve 1.0 mg of *diclofenac impurity A CRS* in *methanol R*, add 1.0 ml of the test solution and dilute to 200.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *end-capped octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 34 volumes of a solution containing 0.5 g/l of *phosphoric acid R* and 0.8 g/l of *sodium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R*, and 66 volumes of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). When the chromatograms are recorded in the prescribed conditions, the retention times are about 25 min for diclofenac and about 12 min for impurity A. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained with reference solution (b) is not less than 50 per cent of the full scale of the recorder. Continue the chromatography for 1.5 times the retention time of diclofenac. The test is not valid unless in the chromatogram obtained the resolution between the peaks corresponding to diclofenac and impurity A is at least 6.5.

Inject 20 µl of the test solution and 20 µl of reference solution (a). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than 2.5 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 2.0 g complies with limit test C (10 ppm). Use a quartz crucible. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 0.250 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 31.81 mg of C₁₄H₁₀Cl₂NNaO₂.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. 1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one,

- B. R1 = CHO, R2 = Cl: 2-[(2,6-dichlorophenyl)amino]benzaldehyde,
 C. R1 = CH₂OH, R2 = Cl: [2-[(2,6-dichlorophenyl)amino]phenyl]methanol,
 D. R1 = CH₂-CO₂H, R2 = Br: 2-[2-[(2-bromo-6-chlorophenyl)amino]phenyl]acetic acid,

- E. 1,3-dihydro-2H-indol-2-one.

01/2005:0663

DICLOXACILLIN SODIUM

Dicloxacillinum natricum

C₁₉H₁₆Cl₂N₃NaO₅S·H₂OM_r 510.3

DEFINITION

Dicloxacillin sodium contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of sodium (2S,5R,6R)-6-[[[3-(2,6-dichlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dicloxacillin sodium CRS*. Examine the substances prepared as discs.
 B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.
Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.
Reference solution (a). Dissolve 25 mg of *dicloxacillin sodium CRS* in 5 ml of *water R*.
Reference solution (b). Dissolve 25 mg each of *cloxacillin sodium CRS*, *dicloxacillin sodium CRS* and *flucloxacillin sodium CRS* in 5 ml of *water R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R* the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the colour of the solution is slightly greenish-yellow. Place the test-tube in a water-bath for 1 min; a yellow colour develops.
 D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 430 nm is not greater than 0.04.

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 128 to + 143, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject test solution (a) and continue the chromatography for five times the retention time of the principal peak. In the chromatogram obtained with test solution (a): the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

N,N-Dimethylaniline (2.4.26, *Method B*). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.8 per cent *m/m*.

Water (2.5.12): 3.0 per cent to 4.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of a solution in *water for injections R* containing 20 mg of the substance to be examined per millilitre.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *dicloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of test solution (b) to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *flucloxacillin sodium CRS* and 5 mg of *dicloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 75 volumes of a 2.7 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R* and 25 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 225 nm,
- a 20 µl loop injector.

Inject reference solution (c). When the chromatograms are recorded in the prescribed conditions, the retention time of dicloxacillin is about 10 min. Adjust the sensitivity of the system so that the heights of the principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained, the resolution between the first peak (flucloxacillin) and the second peak (dicloxacillin) is at least 2.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for dicloxacillin is at most 1.0 per cent. Inject alternately test solution (b) and reference solution (a).

STORAGE

Store in an airtight container, at a temperature not exceeding 25 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

IMPURITIES

- A. R = CO₂H: (4S)-2-[carboxy[[[3-(2,6-dichlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of dicloxacillin),
- B. R = H: (2RS,4S)-2-[[[3-(2,6-dichlorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of dicloxacillin),

- C. (2S,5R,6R)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- D. 3-(2,6-dichlorophenyl)-5-methylisoxazole-4-carboxylic acid.

01/2005:1197

DICYCLOVERINE HYDROCHLORIDE

Dicycloverini hydrochloridum

C₁₉H₃₆ClNO₂M_r 346.0

DEFINITION

Dicycloverine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-(diethylamino)ethyl bicyclohexyl-1-carboxylate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, freely soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dicycloverine hydrochloride CRS*. Examine the substances prepared as discs using *potassium chloride R*. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).
- C. To 3 ml of a 1.0 g/l solution of *sodium laurilsulfate R* add 5 ml of *methylene chloride R* and 0.05 ml of a 2.5 g/l solution of *methylene blue R*, mix gently and allow to stand; the lower layer is blue. Add 2 ml of a 20 g/l

solution of the substance to be examined, mix gently and allow to stand; the upper layer is blue and the lower layer is colourless.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in *water R* and dilute to 50 ml with the same solvent. The pH of the solution is 5.0 to 5.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of *dicycloverine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 5 mg of *tropicamide CRS* in reference solution (b) and dilute to 5 ml with the same solution.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 10 volumes of *ethyl acetate R*, 10 volumes of *water R* and 75 volumes of *propanol R*. Dry the plate in a current of warm air. Spray with *dilute potassium iodobismuthate solution R*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 34.60 mg of $C_{19}H_{18}O_2$.

IMPURITIES

A. bicyclohexyl-1-carboxylic acid.

01/2005:0483

DIENESTROL

Dienestrolum

$C_{18}H_{18}O_2$

M_r 266.3

DEFINITION

Dienestrol contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (*E,E*)-4,4'-(1,2-diethylidene-ethylene)diphenol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in alcohol. It dissolves in dilute solutions of the alkali hydroxides.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dienestrol CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a).
- Dissolve about 1 mg in 5 ml of *glacial acetic acid R*, add 1 ml of a 1 per cent V/V solution of *bromine R* in *glacial acetic acid R* and heat in a water-bath for 2 min. Place 0.5 ml of this solution in a dry test-tube, add 0.5 ml of *ethanol R*, mix and add 10 ml of *water R*. A reddish-violet colour is produced. Add 5 ml of *chloroform R*, shake vigorously and allow to separate. The chloroform layer is red and the aqueous layer is almost colourless.
- Dissolve about 0.5 mg in 0.2 ml of *glacial acetic acid R*, add 1 ml of *phosphoric acid R* and heat on a water-bath for 3 min. A reddish-violet colour is produced.

TESTS

Melting range. Determined by the capillary method (2.2.14), the melting point is 227 °C to 234 °C. The temperature interval between the formation of a definite meniscus in the melt and the disappearance of the last particle does not exceed 3 °C.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in 2 ml of *alcohol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *alcohol R*.

Reference solution (a). Dissolve 25 mg of *dienestrol CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *alcohol R*.

Reference solution (c). Dissolve 10 mg of *diethylstilbestrol CRS* in 2 ml of *alcohol R*. To 1 ml of this solution add 1 ml of reference solution (a).

Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *diethylamine R* and 90 volumes of *toluene R*. Allow the plate to dry in air, spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows at least two clearly separated spots having approximately the same intensity.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 25.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. To 5.0 ml of this solution add 10 ml of *ethanol R* and dilute to 250.0 ml with 0.1 M *sodium hydroxide*. Prepare a reference solution in the same manner using 25.0 mg of *dienestrol CRS*. Measure the absorbance (2.2.25) of the solutions at the maximum at 245 nm. Calculate the content of $C_{18}H_{18}O_2$ from the measured absorbances and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:0897

DIETHYL PHTHALATE

Diethylis phthalas

$C_{12}H_{14}O_4$

M_r 222.2

DEFINITION

Diethyl phthalate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent *m/m* of diethyl benzene-1,2-dicarboxylate.

CHARACTERS

A clear, oily liquid, colourless or very slightly yellow, practically insoluble in water, miscible with alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, D, E.

A. Relative density (2.2.5): 1.117 to 1.121.

B. Refractive index (2.2.6): 1.500 to 1.505.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diethyl phthalate CRS*. Examine as thin films.

D. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in *ether R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *diethyl phthalate CRS* in *ether R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *heptane R* and 70 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

E. To about 0.1 ml add 0.25 ml of *sulphuric acid R* and 50 mg of *resorcinol R*. Heat on a water-bath for 5 min. Allow to cool. Add 10 ml of *water R* and 1 ml of *strong sodium hydroxide solution R*. The solution becomes yellow or brownish-yellow and shows green fluorescence.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, Method II).

Acidity. Dissolve 20.0 g in 50 ml of *alcohol R* previously neutralised to *phenolphthalein solution R1*. Add 0.2 ml of *phenolphthalein solution R1*. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Examine by gas chromatography (2.2.28), using *naphthalene R* as the internal standard.

Internal standard solution. Dissolve 60 mg of *naphthalene R* in *methylene chloride R* and dilute to 20 ml with the same solvent.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *methylene chloride R*, add 2.0 ml of the internal standard solution and dilute to 20.0 ml with *methylene chloride R*.

Reference solution. To 1.0 ml of test solution (a) add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *methylene chloride R*.

The chromatographic procedure may be carried out using:

- a glass column 2 m long and 2 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* (150 µm to 180 µm) impregnated with 3 per cent *m/m* of *polymethylphenylsiloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 150 °C and that of the injection port and of the detector at 225 °C.

Inject 1 µl of the reference solution. The substances are eluted in the following order: naphthalene and diethyl phthalate. Adjust the sensitivity of the detector so that the height of the peak due to naphthalene is not less than 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to naphthalene and diethyl phthalate is at least 10.

Inject 1 µl of test solution (a). In the chromatogram obtained, verify that there is no peak with the same retention time as the internal standard.

Inject separately 1 µl of test solution (b) and 1 µl of the reference solution. Continue the chromatography for three times the retention time of diethyl phthalate. From the chromatogram obtained with the reference solution, calculate the ratio (*R*) of the area of the peak due to diethyl phthalate to the area of the peak due to the internal standard. From the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peaks due to the internal standard and the solvent, to the area of the peak due to the internal standard; this ratio is not greater than *R* (1.0 per cent).

Water (2.5.12). Not more than 0.2 per cent, determined on 5.0 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Introduce 0.750 g into a 250 ml borosilicate glass flask. Add 25.0 ml of 0.5 *M* alcoholic potassium hydroxide and a few glass beads. Boil on a water-bath under a reflux condenser for 1 h. Add 1 ml of phenolphthalein solution R1 and titrate immediately with 0.5 *M* hydrochloric acid. Carry out a blank titration. Calculate the volume of 0.5 *M* alcoholic potassium hydroxide used in the saponification.

1 ml of 0.5 *M* alcoholic potassium hydroxide is equivalent to 55.56 mg of C₁₂H₁₄O₄.

STORAGE

Store in an airtight container.

01/2005:0271

DIETHYLCARBAMAZINE CITRATE

Diethylcarbamazini citras

C₁₆H₂₉N₃O₈

M_r 391.4

DEFINITION

Diethylcarbamazine citrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of *N,N*-diethyl-4-methylpiperazine-1-carboxamide dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, very soluble in water, soluble in alcohol, practically insoluble in acetone.

It melts at about 138 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with diethylcarbamazine citrate CRS.
- Examine the chromatograms obtained in the test for dimethylpiperazine and methylpiperazine. The principal spot in the chromatogram obtained with the test solution

corresponds in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- Dissolve 0.1 g in 5 ml of *water R*. The solution gives the reaction of citrates (2.3.1).

TESTS

Solution S. Shake 2.5 g with *water R* until dissolved and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Dimethylpiperazine and methylpiperazine. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 0.1 g of diethylcarbamazine citrate CRS in *methanol R* and dilute to 2.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of methylpiperazine *R* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of dimethylpiperazine *R* in *methanol R* and dilute to 100 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 5 volumes of concentrated ammonia *R*, 30 volumes of methyl ethyl ketone *R* and 65 volumes of *methanol R*. Dry the plate at 100-105 °C and expose to iodine vapour for 30 min. In the chromatogram obtained with the test solution, any spots corresponding to methylpiperazine and dimethylpiperazine are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively (0.2 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using 10 ml of lead standard solution (2 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.0 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 25 ml of *anhydrous acetic acid R* and add 25 ml of *acetic anhydride R*. Using 0.2 ml of *crystal violet solution R* as indicator, titrate with 0.1 *M* perchloric acid until a greenish-blue colour is obtained.

1 ml of 0.1 *M* perchloric acid is equivalent to 39.14 mg of C₁₆H₂₉N₃O₈.

STORAGE

Store in an airtight container.

01/2005:1198

DIETHYLENE GLYCOL MONOETHYL ETHER

Diethylenglycoli monoethylicum aetherum

C₆H₁₄O₃

M_r 134.2

DEFINITION

2-(2-Ethoxyethoxy)ethanol, produced by condensation of ethylene oxide and alcohol, followed by distillation.

CHARACTERS

Appearance: clear, colourless, hygroscopic liquid.

Solubility: miscible with water, with acetone and with alcohol, miscible in certain proportions with vegetable oils, not miscible with mineral oils.

Relative density: about 0.991.

IDENTIFICATION

A. Refractive index (2.2.6): 1.426 to 1.428.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of diethylene glycol monoethyl ether.*

TESTS

Acid value (2.5.1): maximum 0.1.

Mix 30.0 ml with 30 ml of *alcohol R* previously neutralised with 0.1 M *potassium hydroxide* using *phenolphthalein solution R* as indicator. Titrate with 0.01 M *alcoholic potassium hydroxide*.

Peroxide value (2.5.5): maximum 8.0, determined on 2.00 g.

Related substances. Gas chromatography (2.2.28).

Internal standard solution. Dilute 1.00 g of *decane R* to 100.0 ml with *methanol R*.

Test solution. To 5.00 g of the substance to be examined, add 0.1 ml of the internal standard solution and dilute to 10.0 ml with *methanol R*.

Reference solution (a). Dilute 25.0 mg of *ethylene glycol monomethyl ether R*, 80.0 mg of *ethylene glycol monoethyl ether R*, 0.310 g of *ethylene glycol R* and 0.125 g of *diethylene glycol R* to 100.0 ml with *methanol R*. To 1.0 ml of this solution add 0.1 ml of the internal standard solution and dilute to 10.0 ml with *methanol R*.

Reference solution (b). Dilute 25.0 mg of *ethylene glycol monoethyl ether R* and 25.0 mg of *ethylene glycol R* to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 5.0 ml with *methanol R*.

Reference solution (c). Dilute 1.00 g of the substance to be examined to 100.0 ml with *methanol R*. To 1.0 ml of this solution add 0.1 ml of the internal standard solution and dilute to 10.0 ml with *methanol R*.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** *poly(cyanopropyl)(7)(phenyl)(7)methyl(86)siloxane R* (film thickness 1 μ m).

Carrier gas: *nitrogen for chromatography R* or *helium for chromatography R*.

Flow rate: 2.0 ml/min.

Split ratio: 1:80.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	120
	1 - 10	120 → 225
	10 - 12	225
Injection port		275
Detector		250

Detection: flame ionisation.

Injection: 0.5 μ l.

Relative retentions with reference to diethylene glycol monoethyl ether (retention time = about 4 min): ethylene glycol monomethyl ether = about 0.4; ethylene glycol monoethyl ether = about 0.5; ethylene glycol = about 0.55; diethylene glycol = about 1.1.

System suitability:

- **resolution:** minimum 3.0 between the peaks due to ethylene glycol monoethyl ether and to ethylene glycol in the chromatogram obtained with reference solution (b),
- **signal-to-noise ratio:** minimum 3.0 for the peak due to ethylene glycol monomethyl ether in the chromatogram obtained with reference solution (a),

Limits (take into account the impurity/internal standard peak area ratio):

- **ethylene glycol monomethyl ether:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (50 ppm),
- **ethylene glycol monoethyl ether:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (160 ppm),
- **ethylene glycol:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (620 ppm),
- **diethylene glycol:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (250 ppm),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent).

Ethylene oxide. Head-space gas chromatography (2.2.28).

Test solution. To 1.00 g of the substance to be examined in a vial, add 50 μ l of *water R*.

Reference solution. To 1.00 g of the substance to be examined in a vial, add 50 μ l of *ethylene oxide solution R4* and close tightly.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** *poly(cyanopropyl)(7)(phenyl)(7)methyl(86)siloxane R* (film thickness 1 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.1 ml/min.

Static head-space conditions which may be used:

- **equilibration temperature:** 80 °C,
- **equilibration time:** 45 min,
- **transfer line temperature:** 110 °C,
- **pressurisation time:** 2 min,
- **injection time:** 12 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	40
	5 - 18	40 → 200
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 1.0 ml.

The peak due to ethylene oxide is identified by injecting solutions of ethylene oxide of increasing concentration.

Determine the content of ethylene oxide (ppm) in the substance to be examined using the following expression:

$$\frac{S_T \times C}{(S_S \times M_T) - (S_T \times M_S)}$$

S_T = area of the peak corresponding to ethylene oxide in the chromatogram obtained with the test solution,

S_S = area of the peak corresponding to ethylene oxide in the chromatogram obtained with the reference solution,

M_T = mass of the substance to be examined in the test solution, in grams,

M_S = mass of the substance to be examined in the reference solution, in grams,

C = mass of added ethylene oxide in the reference solution, in micrograms.

Limit:

– *ethylene oxide*: maximum 1 ppm.

Water (2.5.12): maximum 0.1 per cent, determined on 10.0 g.

STORAGE

Under an inert gas, in an airtight container.

LABELLING

The label states that the substance is stored under an inert gas.

01/2005:1415

DIETHYLENE GLYCOL MONOPALMITOSTEARATE

Diethylenglycoli monopalmitostearas

DEFINITION

Diethylene glycol monopalmitostearate is a mixture of diethylene glycol mono- and diesters of stearic and palmitic acids. It contains not less than 45.0 per cent of monoesters produced from the condensation of diethylene glycol and stearic acid 50 of vegetable or animal origin.

CHARACTERS

A white or almost white, waxy solid, practically insoluble in water, soluble in acetone and in hot alcohol.

IDENTIFICATION

- It complies with the test for melting point (see Tests).
- It complies with the test for composition of fatty acids (see Tests).
- It complies with the assay (monoesters content).

TESTS

Melting point (2.2.15): 43 °C to 50 °C.

Acid value (2.5.1). Not more than 4.0, determined on 10.0 g.

Iodine value (2.5.4). Not more than 3.0.

Saponification value (2.5.6): 150 to 170, determined on 2.0 g.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction has the following composition:

- *stearic acid*: 40.0 per cent to 60.0 per cent,
- *sum of contents of palmitic acid and stearic acid*: not less than 90.0 per cent.

Free diethylene glycol. Not more than 8.0 per cent, determined as prescribed under Assay.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Determine the free diethylene glycol content and monoesters content by size-exclusion chromatography (2.2.30).

Test solution. Into a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Heat gently, if necessary. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, respectively weigh, to the nearest 0.1 mg, about 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *diethylene glycol R*. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Weigh the flasks again and calculate the concentration of diethylene glycol in milligrams per gram for each reference solution.

The chromatographic procedure may be carried out using:

- a gel-permeation column 0.6 m long and 7 mm in internal diameter packed with *styrene-divinylbenzene copolymer R* (particle diameter 5 µm and pore size 10 nm),
- as mobile phase at a flow rate of 1 ml/min *tetrahydrofuran R*,
- a differential refractive index detector.

Inject 40 µl of each solution. When the chromatograms are recorded in the prescribed conditions, the retention times relative to diethylene glycol are about 0.84 for the monoesters and about 0.78 for the diesters. From the calibration curve obtained with the reference solutions determine the concentration (*C*) in milligrams per gram of diethylene glycol in the test solution.

Calculate the percentage content of free diethylene glycol in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

From the peak area of the monoesters (*A*) and the diesters (*B*), calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A + B} \times (100 - D)$$

D = the percentage content of free diethylene glycol and the percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the expression:

$$\frac{I_A \times 270}{561.1}$$

I_A = acid value.

STORAGE

Store protected from light.

01/2005:0484

DIETHYLSTILBESTROL**Diethylstilbestrolum** $C_{18}H_{20}O_2$ M_r 268.4**DEFINITION**

Diethylstilbestrol contains not less than 97.0 per cent and not more than the equivalent of 101.0 per cent of (*E*)-4,4'-(1,2-diethylethene-1,2-diyl)diphenol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in alcohol. It dissolves in solutions of the alkali hydroxides.

It melts at about 172 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Examined between 230 nm and 450 nm (2.2.25), the irradiated solution of the substance to be examined prepared as prescribed in the assay shows two absorption maxima, at 292 nm and 418 nm.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diethylstilbestrol CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for mono- and dimethyl ethers. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 0.5 mg in 0.2 ml of *glacial acetic acid R*, add 1 ml of *phosphoric acid R* and heat on a water-bath for 3 min. A deep-yellow colour develops.

TESTS

4,4'-Dihydroxystilbene and related ethers. Dissolve 0.100 g in *ethanol R* and dilute to 10.0 ml with the same solvent. The absorbance (2.2.25) of the solution measured at 325 nm is not greater than 0.50.

Mono- and dimethyl ethers. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in 2 ml of *alcohol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *alcohol R*.

Reference solution (a). Dissolve 10 mg of *diethylstilbestrol CRS* in 2 ml of *alcohol R*.

Reference solution (b). Dissolve 5 mg of *diethylstilbestrol monomethyl ether CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 5 mg of *diethylstilbestrol dimethyl ether CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (d). Dissolve 10 mg of *dienestrol CRS* in 2 ml of *alcohol R*. To 1 ml of this solution add 1 ml of reference solution (a).

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *diethylamine R* and 90 volumes of *toluene R*. Allow the plate to dry in air, spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min. In the chromatogram obtained with test solution (a), any spots corresponding to diethylstilbestrol monomethyl ether and diethylstilbestrol dimethyl ether are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively (0.5 per cent). Diethylstilbestrol gives one or sometimes two spots. The test is not valid unless the chromatogram obtained with reference solution (d) shows at least two clearly separated spots having approximately the same intensity.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 20.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R*. To 25.0 ml of the resulting solution add 25.0 ml of a solution of 1 g of *dipotassium hydrogen phosphate R* in 55 ml of *water R*. Prepare in the same manner a reference solution using 20.0 mg of *diethylstilbestrol CRS*. Transfer an equal volume of each solution to separate 1 cm quartz cells and close the cells; place the two cells about 5 cm from a low-pressure, short-wave 2 W to 20 W mercury lamp and irradiate for about 5 min. Measure the absorbance (2.2.25) of the irradiated solutions at the maximum at 418 nm, using *water R* as the compensation liquid. Continue the irradiation for successive periods of 3 min to 15 min, depending on the power of the lamp, and repeat the measurement of the absorbances at 418 nm until the maximum absorbance (about 0.7) is obtained. If necessary, adjust the geometry of the irradiation apparatus to obtain a maximum, reproducible absorbance at 418 nm.

Calculate the content of $C_{18}H_{20}O_2$ from the measured absorbances and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:0818

DIFLUNISAL**Diflunisalum** $C_{13}H_8F_2O_3$ M_r 250.2**DEFINITION**

Diflunisal contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2',4'-difluoro-4-hydroxybiphenyl-3-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Dissolve 10 mg in a 0.3 per cent V/V solution of *hydrochloric acid R* in *methanol R* and dilute to 100.0 ml with the same acid solution. Dilute 2.0 ml of the solution to 10.0 ml with a 0.3 per cent V/V solution of *hydrochloric acid R* in *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 251 nm and 315 nm. The ratio of the absorbance measured at the maximum at 251 nm to that measured at the maximum at 315 nm is 4.2 to 4.6.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diflunisal CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.
- C. Dissolve about 2 mg in 10 ml of *alcohol R* and add 0.1 ml of *ferric chloride solution R1*. A violet-red colour is produced.
- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. Dissolve 0.5 g in *alcohol R* and dilute to 50 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Related substances

- A. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *biphenyl-4-ol R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *methanol R*.

Reference solution (b). Dissolve 20 mg of *biphenyl-4-ol R* in *methanol R*, add 1 ml of the test solution and dilute to 10 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *glacial acetic acid R*, 20 volumes of *acetone R* and 70 volumes of *methylene chloride R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any

spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.15 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

- B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the reference solution and dilute to 10.0 ml with the same solution.

Reference solution. Dissolve 55.0 mg of *fluoranthene R* in a mixture of 1 volume of *water R* and 4 volumes of *acetonitrile R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml to 100.0 ml with a mixture of 1 volume of *water R* and 4 volumes of *acetonitrile R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 2 volumes of *glacial acetic acid R*, 25 volumes of *methanol R*, 55 volumes of *water R* and 70 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of the reference solution and adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained is not less than 10 per cent of the full scale of the recorder. Inject separately 20 µl of the test solution and 20 µl of the reference solution. Continue the chromatography for three times the retention time of fluoranthene. In the chromatogram obtained with the test solution, the sum of the areas of any peaks, apart from the principal peak, with a retention time greater than that of fluoranthene is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Use a platinum crucible. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.3 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 700 Pa for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.200 g in 40 ml of *methanol R*. Add 5 ml of *water R* and 0.2 ml of *phenol red solution R*. Titrate with 0.1 M *sodium hydroxide* until the colour changes from yellow to reddish-violet.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 25.02 mg of C₁₃H₈F₂O₃.

STORAGE

Store protected from light.

IMPURITIES

- A. R1 = R2 = R3 = H: biphenyl-4-ol,
 B. R1 = H, R2 = R3 = F: 2',4'-difluorobiphenyl-4-ol,
 C. R1 = CO-CH₃, R2 = R3 = F: 2',4'-difluorobiphenyl-4-yl acetate,
 D. condensation products.

01/2005:0117

DIGITALIS LEAF

Digitalis purpureae folium

DEFINITION

Digitalis leaf consists of the dried leaf of *Digitalis purpurea* L. It contains not less than 0.3 per cent of cardenolic glycosides, expressed as digitoxin (*M_r* 765), and calculated with reference to the drug dried at 100 °C to 105 °C.

CHARACTERS

Digitalis leaf has a faint but characteristic odour. The whole leaf is about 10 cm to 40 cm long and 4 cm to 15 cm wide. The lamina is ovate lanceolate to broadly ovate. The winged petiole is from one quarter as long as to equal in length to the lamina.

It has the macroscopic and microscopic characters described in identification tests A and B.

IDENTIFICATION

- A. The leaf is brittle and often occurs broken. The upper surface is green and the lower surface is greyish-green. The apex is subacute and the margin is irregularly crenate, dentate or serrate. The base is decurrent. The venation is pinnate, the lateral veins being prominent especially on the lower surface, leaving the midrib at about 45° and anastomosing near the margin; a veinlet terminates in each tooth of the margin and the lower veins run down the winged petiole. The upper surface is rugose and pubescent; the lower surface shows a network of raised veinlets and is densely pubescent.
- B. Reduce to a powder (355). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epidermal cells with anticlinal walls which are straight or slightly sinuous on the upper surface and markedly sinuous on the lower surface; the cuticle is smooth. Trichomes are of two types: uniseriate, bluntly pointed non-glandular, usually of three to five cells, often with one or more collapsed cells, walls mostly finely warty or faintly striated; glandular trichomes usually with a unicellular, sometimes a multicellular uniseriate stalk and a unicellular or bicellular or exceptionally tetracellular head. Anomocytic stomata (2.8.3) are absent or very rare on the upper surface, numerous on the lower surface. Calcium oxalate crystals and sclerenchyma are absent.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.
Test solution. To 1.0 g of the powdered drug (180) add a mixture of 20 ml of *alcohol (50 per cent V/V) R* and 10 ml of *lead acetate solution R*. Boil for 2 min, allow to cool and centrifuge. Shake the supernatant solution with

two quantities, each of 15 ml, of *chloroform R*; separate the two layers by centrifugation if necessary. Dry the chloroform layers over *anhydrous sodium sulphate R* and filter. Evaporate 10 ml of the solution to dryness on a water-bath and dissolve the residue in 1 ml of a mixture of equal volumes of *chloroform R* and *methanol R*.

Reference solution. Dissolve 5 mg of *purpureaglycoside A CRS*, 2 mg of *purpureaglycoside B CRS*, 5 mg of *digitoxin R* and 2 mg of *gitoxin R* in a mixture of equal volumes of *chloroform R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate as bands 2 cm by 0.3 cm 20 µl of each solution. Develop over a path of 10 cm using a mixture of 7.5 volumes of *water R*, 10 volumes of *methanol R* and 75 volumes of *ethyl acetate R*. Allow the solvents to evaporate. Spray with a mixture of 2 volumes of a 10 g/l solution of *chloramine R* and 8 volumes of a 250 g/l solution of *trichloroacetic acid R* in *alcohol R*. Heat at 100 °C to 105 °C for 10 min. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows a zone of light-blue fluorescence in the lower part of the chromatogram, corresponding to purpureaglycoside B, and just above it a zone of brownish-yellow fluorescence, corresponding to purpureaglycoside A. A zone of light-blue fluorescence, corresponding to gitoxin, appears in the middle of the chromatogram and above it a zone of brownish-yellow fluorescence, corresponding to digitoxin. The zones in the chromatogram obtained with the test solution are similar in position, colour and size to the zones in the chromatogram obtained with the reference solution. Other zones of fluorescence may also appear in the chromatogram obtained with the test solution.

- D. Evaporate 5 ml of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 2 ml of *dinitrobenzoic acid solution R* and 1 ml of 1 M *sodium hydroxide*. A reddish-violet colour develops within 5 min.
- E. Evaporate 5 ml of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 3 ml of *xanthidrol solution R* and heat on a water-bath for 3 min. A red colour develops.

TESTS

Foreign matter (2.8.2). There are no leaves with few or no trichomes and epidermal cells showing, in surface view, beaded anticlinal walls (*Digitalis lanata*).

Loss on drying (2.2.32). Not more than 6.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 5.0 per cent.

ASSAY

Shake 0.250 g of the powdered drug (180) with 50.0 ml of *water R* for 1 h. Add 5.0 ml of a 150 g/l solution of *lead acetate R*, shake and after a few minutes add 7.5 ml of a 40 g/l solution of *disodium hydrogen phosphate R*. Filter through a pleated filter paper. Heat 50.0 ml of the filtrate with 5 ml of hydrochloric acid (150 g/l HCl) under a reflux condenser on a water-bath for 1 h. Transfer to a separating funnel, rinse the flask with two quantities, each of 5 ml, of *water R* and shake with three quantities, each of 25 ml, of *chloroform R*. Dry the combined chloroform layers over *anhydrous sodium sulphate R* and dilute to 100.0 ml with *chloroform R*. Evaporate 40.0 ml of the chloroformic

solution to dryness, dissolve the residue in 7 ml of *alcohol* (50 per cent V/V) *R* and add 2 ml of *dinitrobenzoic acid solution R* and 1 ml of 1 *M* *sodium hydroxide*. At the same time prepare a reference solution as follows. Dissolve 50.0 mg of *digitoxin CRS* in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *alcohol R*. To 5.0 ml of the resulting solution add 25 ml of *water R* and 3 ml of hydrochloric acid (150 g/l HCl). Heat the solution under a reflux condenser on a water-bath for 1 h and complete the preparation as described above. Measure the absorbance (2.2.25) of the two solutions at 540 nm several times during the first 12 min until the maximum is reached, using as the compensation liquid a mixture of 7 ml of *alcohol* (50 per cent V/V) *R*, 2 ml of *dinitrobenzoic acid solution R* and 1 ml of 1 *M* *sodium hydroxide*.

From the absorbances measured and the concentrations of the solutions, calculate the content of cardenolic glycosides, expressed as digitoxin.

STORAGE

Store protected from light and moisture.

01/2005:0078

DIGITOXIN

Digitoxinum

$C_{41}H_{64}O_{13}$

M_r 765

DEFINITION

Digitoxin contains not less than 95.0 per cent and not more than the equivalent of 103.0 per cent of 3β-[(O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-14-hydroxy-5β,14β-card-20(22)-enolide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in a mixture of equal volumes of methanol and methylene chloride, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *digitoxin CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Suspend about 0.5 mg in 0.2 ml of *alcohol* (60 per cent V/V) *R*. Add 0.1 ml of *dinitrobenzoic acid solution R* and 0.1 ml of *dilute sodium hydroxide solution R*. A violet colour develops.
- Dissolve about 0.5 mg in 1 ml of *glacial acetic acid R*, heating gently, allow to cool and add 0.05 ml of *ferric chloride solution R1*. Cautiously add 1 ml of *sulphuric acid R*, avoiding mixing the two liquids. A brown ring develops at the interface and on standing a green, then blue colour passes to the upper layer.

TESTS

Appearance of solution. Dissolve 50 mg in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The solution is clear (2.2.1) and colourless (2.2.2, *Method I*).

Specific optical rotation (2.2.7). Dissolve 0.25 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 16.0 to + 18.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 20 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 2 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *digitoxin CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 2 ml with the same mixture of solvents.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 50 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (c). Dissolve 10 mg of *gitoxin CRS* with stirring in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (d). Dilute 1 ml of reference solution (b) to 2 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (e). Mix 1 ml of reference solution (a) and 1 ml of reference solution (c).

Apply to the plate 5 µl of each solution. Develop immediately over a path of 15 cm using a mixture of 15 volumes of *methanol R*, 40 volumes of *cyclohexane R* and 90 volumes of *methylene chloride R*. Dry the plate in a stream of cold air for 5 min. Repeat the development and dry the plate in a stream of cold air for 5 min. Spray with a mixture of 1 volume of *sulphuric acid R* and 9 volumes of *alcohol R* and heat at 130 °C for 15 min. Examine in daylight.

Gitoxin. Any spot corresponding to gitoxin in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c) (2.0 per cent).

Other glycosides. Any spot in the chromatogram obtained with the test solution, apart from the principal spot and the spot corresponding to gitoxin, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

The test is not valid unless the chromatogram obtained with reference solution (e) shows clearly separated spots corresponding to digitoxin, gitoxin and other glycosides and the spot in the chromatogram obtained with reference solution (d) is clearly visible.

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue from the test for loss on drying.

ASSAY

Dissolve 40.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *alcohol R*. Prepare a reference solution in the same manner, using 40.0 mg of *digitoxin CRS*. To 5.0 ml of each solution add 3.0 ml of *alkaline sodium picrate solution R*, allow to stand protected from bright light for 30 min and measure the absorbance (2.2.25) of each solution at the maximum at 495 nm, using as the compensation liquid a mixture of 5.0 ml of *alcohol R* and 3.0 ml of *alkaline sodium picrate solution R* prepared at the same time.

Calculate the content of $C_{41}H_{64}O_{13}$ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:0079

DIGOXIN

Digoxinum

$C_{41}H_{64}O_{14}$

M_r 781

DEFINITION

Digoxin contains not less than 95.0 per cent and not more than the equivalent of 103.0 per cent of $3\beta-[(O-2,6-dideoxy-\beta-D-ribo-hexopyranosyl-(1\rightarrow4)-O-2,6-dideoxy-\beta-D-ribo-hexopyranosyl-(1\rightarrow4)-2,6-dideoxy-\beta-D-ribo-hexopyranosyl)oxy]-12\beta,14-dihydroxy-5\beta-card-20(22)-enolide$, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder or colourless crystals, practically insoluble in water, freely soluble in a mixture of equal volumes of methanol and methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *digoxin CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Suspend about 0.5 mg in 0.2 ml of *alcohol (60 per cent V/V) R*. Add 0.1 ml of *dinitrobenzoic acid solution R* and 0.1 ml of *dilute sodium hydroxide solution R*. A violet colour develops.
- Dissolve about 0.5 mg in 1 ml of *glacial acetic acid R*, heating gently, allow to cool and add 0.05 ml of *ferric chloride solution R1*. Cautiously add 1 ml of *sulphuric acid R* avoiding mixing the two liquids. A brown ring develops at the interface and on standing a green, then blue colour passes to the upper layer.

TESTS

Appearance of solution. Dissolve 50 mg in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The solution is clear (2.2.1) and colourless (2.2.2, *Method I*).

Specific optical rotation (2.2.7). Dissolve 0.20 g in *anhydrous pyridine R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 10.0 to + 13.0, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *kieselguhr G R* as the coating substance. Impregnate the plate by placing it in a closed chromatographic tank containing the necessary quantity of a mixture of 10 volumes of *formamide R* and 90 volumes of *acetone R* so that the plate dips about 5 mm into the liquid. When the impregnation mixture has risen at least 15 cm from the lower edge of the plate, remove the plate and allow the solvent to evaporate for 30 min. Use the plate immediately.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *digoxin CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 2 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of reference solution (a) to 50 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 4 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (d). Dissolve 5 mg of *digitoxin CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (e). Dissolve 5 mg of *gitoxin CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 25 ml with the same mixture of solvents.

Apply separately to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 4 volumes of *formamide R*, 50 volumes of *methyl ethyl ketone R* and 50 volumes of *xylene R*. Dry the plate in a current of cold

01/2005:1310
corrected

air until only the lower edge is still visibly moist. Repeat the development and dry the plate at 115 °C for 20 min. Allow to cool, spray with a mixture of 1 volume of a freshly prepared 30 g/l solution of *chloramine R* and 15 volumes of a 250 g/l solution of *trichloroacetic acid R* in *alcohol R* and heat at 115 °C for 5 min. Examine in ultraviolet light at 365 nm. Any spot corresponding to digitoxin in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (d) (1.0 per cent). Any spot corresponding to gitoxin in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (e) (2.0 per cent). Any spot in the chromatogram obtained with the test solution, apart from the principal spot and spots corresponding to digitoxin and gitoxin, is not more intense than the spot in the chromatogram obtained with reference solution (b) (2.0 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying *in vacuo*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue from the test for loss on drying.

ASSAY

Dissolve 40.0 mg in *alcohol R*, heating if necessary, and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *alcohol R*. Prepare a reference solution in the same manner, using 40.0 mg of *digoxin CRS*. To 5.0 ml of each solution add 3.0 ml of *alkaline sodium picrate solution R*, allow to stand protected from bright light for 30 min and measure the absorbance (2.2.25) of each solution at the maximum at 495 nm, using as the compensation liquid a mixture of 5.0 ml of *alcohol R* and 3.0 ml of *alkaline sodium picrate solution R* prepared at the same time.

Calculate the content of $C_{41}H_{64}O_{14}$ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

IMPURITIES

A. digitoxin,

B. 3β-[(O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-14,16β-dihydroxy-5β-card-20(22)-enolide (gitoxin).

DIHYDRALAZINE SULPHATE, HYDRATED

Dihydralazini sulfas hydricus

$C_8H_{12}N_6O_4S \cdot 2\frac{1}{2}H_2O$

M_r 333.3

DEFINITION

Hydrated dihydralazine sulphate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (phthalazine-1,4(2*H*,3*H*)-diylidene)dihydrazine sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellow, crystalline powder, slightly soluble in water, practically insoluble in ethanol. It dissolves in dilute mineral acids.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of dihydralazine sulphate hydrated*.
- Dissolve about 50 mg in 5 ml of *dilute hydrochloric acid R*. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.20 g in *dilute nitric acid R* and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in a 6 g/l solution of *glacial acetic acid R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase containing 0.5 g/l of *sodium edetate R*. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase containing 0.5 g/l of *sodium edetate R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase containing 0.5 g/l of *sodium edetate R*.

Reference solution (c). Dissolve 5 mg of *dihydralazine for system suitability CRS* in a 6 g/l solution of *glacial acetic acid R* and dilute to 5.0 ml with the same solvent.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: nitrile silica gel for chromatography *R* (5 µm).

Mobile phase: to 22 volumes of *acetonitrile R* add 78 volumes of a solution containing 1.44 g/l of *sodium laurilsulfate R* and 0.75 g/l of *tetrabutylammonium bromide R* and adjust to pH 3.0 with 0.05 *M* *sulphuric acid*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: twice the retention time of dihydralazine.

Relative retention with reference to dihydralazine: impurity A = about 0.8.

System suitability: reference solution (c):

- the peaks due to impurity A and dihydralazine are baseline separated as in the chromatogram supplied with *dihydralazine for system suitability CRS*.

Limits:

- impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),
- impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- total of impurities other than A:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Hydrazine. Examine by liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 40.0 mg of *hydrazine sulphate R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 25.0 ml with *water R*. To 0.50 ml of the solution, add 0.200 g of the substance to be examined and dissolve in 6 ml of *dilute hydrochloric acid R*, then dilute to 10.0 ml with *water R*. In a centrifuge tube with a ground-glass stopper, place immediately 0.50 ml of the solution and 2.0 ml of a 60 g/l solution of *benzaldehyde R* in a mixture of equal volumes of *methanol R* and *water R*. Shake for 90 s. Add 1.0 ml of *water R* and 5.0 ml of *heptane R*. Shake for 1 min and centrifuge. Use the upper layer.

Reference solution. Dissolve 40.0 mg of *hydrazine sulphate R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 25.0 ml with *water R*. To 0.50 ml of the solution, add 6 ml of *dilute hydrochloric acid R* and dilute to 10.0 ml with *water R*. In a centrifuge tube with a ground-glass stopper, place 0.50 ml of the solution and 2.0 ml of a 60 g/l solution of *benzaldehyde R* in a mixture of equal volumes of *methanol R* and *water R*. Shake for 90 s. Add 1.0 ml of *water R* and 5.0 ml of *heptane R*. Shake for 1 min and centrifuge. Use the upper layer.

Blank solution. Prepare in the same manner as for the reference solution but replacing the 0.50 ml of hydrazine sulphate solution by 0.50 ml of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of a 0.3 g/l solution of *sodium edetate R* and 70 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 305 nm.

Inject 20 µl each of the test solution, the reference solution and the blank solution. Comparing the chromatograms obtained with the reference solution and the blank solution, identify the peak of benzaldehyde azine (benzalazine) corresponding to hydrazine having a retention time relative to the principal peak (benzaldehyde) of about 1.8. In the chromatogram obtained with the test solution, the area of the peak corresponding to benzaldehyde azine is not

greater than twice that of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm of hydrazine).

Iron (2.4.9). To the residue obtained in the test for sulphated ash add 0.2 ml of *sulphuric acid R* and heat carefully until the acid is almost completely eliminated. Allow to cool and dissolve the residue with heating in 5.5 ml of *hydrochloric acid R1*. Filter the hot solution through a filter previously washed 3 times with *dilute hydrochloric acid R*. Wash the crucible and the filter with 5 ml of *water R*. Combine the filtrate and the washings and neutralise with about 3.5 ml of *strong sodium hydroxide solution R*. Adjust the pH to between 3 and 4 with *acetic acid R* and dilute to 20 ml with *water R*. The solution complies with the limit test for iron (20 ppm). Prepare the standard with 5 ml of *iron standard solution (2 ppm Fe) R* and 5 ml of *water R*.

Loss on drying (2.2.32): 13.0 per cent to 15.0 per cent, determined on 1.000 g by drying in an oven at 50 °C at a pressure not exceeding 0.7 kPa for 5 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 60.0 mg in 25 ml of *water R*. Add 35 ml of *hydrochloric acid R* and titrate slowly with 0.05 M *potassium iodate*, determining the end-point potentiometrically (2.2.20), using a calomel reference electrode and a platinum indicator electrode.

1 ml of 0.05 M *potassium iodate* is equivalent to 7.208 mg of C₈H₁₂N₆O₄S.

IMPURITIES

Specified impurities: A, B, C.

A. R = NH₂: 4-hydrazinophthalazin-1-amine,

C. R = H:(phthalazin-1-yl)hydrazine (hydralazine),

B. H₂N-NH₂: hydrazine.

01/2005:1776

DIHYDROCODEINE HYDROGEN TARTRATE

Dihydrocodeini hydrogenotartras

C₂₂H₂₉NO₉

M_r 451.5

DEFINITION

4,5α-Epoxy-3-methoxy-17-methylmorphinan-6α-ol hydrogen (2R,3R)-2,3-dihydroxybutanedioate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in cyclohexane.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of dihydrocodeine hydrogen tartrate.

B. To about 0.1 g add 1 ml of sulphuric acid R and 0.05 ml of ferric chloride solution R1 and heat on a water-bath. A brownish-yellow colour develops. Add 0.05 ml of dilute nitric acid R. The colour does not become red.

C. To 1 ml of solution S (see Tests) add 5 ml of picric acid solution R. Heat on a water-bath until a clear solution is obtained. Allow to cool. A precipitate is formed. Filter, wash with 5 ml of water R and dry at 100–105 °C. The crystals melt (2.2.14) at 220 °C to 223 °C.

D. It gives reaction (b) of tartrates (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in carbon dioxide-free water R and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

pH (2.2.3): 3.2 to 4.2 for solution S.

Specific optical rotation (2.2.7): –70.5 to –73.5 (anhydrous substance).

Dilute 10.0 ml of solution S to 20.0 ml with water R.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.0 mg of codeine phosphate R in 2.0 ml of the test solution and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (5 µm).

Mobile phase: to 1.0 g of sodium heptanesulphonate R, add 10.0 ml of glacial acetic acid R and 4.0 ml of a solution of 5.0 ml of triethylamine R diluted to 25.0 ml with a mixture of equal volumes of water R and acetonitrile R. Add 170 ml of acetonitrile R and dilute to 1000 ml with water R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 284 nm.

Injection: 20 µl.

Run time: 5 times the retention time of dihydrocodeine.

Retention time: dihydrocodeine = about 14 min.

System suitability: reference solution (a):

- resolution: minimum of 2 between the peaks due to dihydrocodeine and to impurity A.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- any other peak: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- total: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); disregard any peak due to tartaric acid (relative retention with reference to dihydrocodeine = about 0.25),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): maximum 0.7 per cent, determined on 1.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 60 ml of anhydrous acetic acid R. Titrate with 0.1 M perchloric acid determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 45.15 mg of C₂₂H₂₉NO₉.

STORAGE

Protected from light.

IMPURITIES

- A. codeine,
B. morphine,

- C. 4,5-epoxy-3-methoxy-17-methylmorphinan-6-one (hydrocodone),

- D. 4,5-epoxy-3,6-dimethoxy-17-methylmorphinan (tetrahydrothebaine).

01/2005:1416 C. Thin-layer chromatography (2.2.27).

DIHYDROERGOCRISTINE MESILATE

Dihydroergocristini mesilas

 $C_{36}H_{45}N_5O_8S$ M_r 708

DEFINITION

(6a*R*,9*R*,10a*R*)-*N*-(2*R*,5*S*,10a*S*,10b*S*)-5-Benzyl-10b-hydroxy-2-(1-methylethyl)-3,6-dioxo-octahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: slightly soluble in water, soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: dihydroergocristine mesilate CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 0.10 g of *dihydroergocristine mesilate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: concentrated ammonia *R*, dimethylformamide *R*, ether *R* (2:15:85 V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate protected from light.

Drying: in a current of cold air for 5 min.

Detection: spray with dimethylaminobenzaldehyde solution *R7* and dry in a current of hot air for 2 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 0.20 g of *methanesulphonic acid R* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: water *R*, concentrated ammonia *R*, butanol *R*, acetone *R* (5:10:20:65 V/V/V/V).

Application: 10 µl.

Development: over a path of 10 cm protected from light.

Drying: in a current of cold air for not more than 1 min.

Detection: spray with a 1 g/l solution of *bromocresol purple R* in *methanol R*, adjusting the colour to violet-red with one drop of *dilute ammonia R1* and dry the plate in a current of hot air at 100 °C.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

Dissolve 0.50 g in *methanol R* and dilute to 25.0 ml with the same solvent.

pH (2.2.3): 4.0 to 5.0.

Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Specific optical rotation (2.2.7): −37 to −43 (dried substance).

Dissolve 0.250 g in *anhydrous pyridine R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Carry out the test and preparation of the solutions protected from bright light.

Test solution. Dissolve 75.0 mg of the substance to be examined in 10 ml of *acetonitrile R*. Add 10 ml of a 1.0 g/l solution of *phosphoric acid R* and dilute to 50.0 ml with *water R*.

Reference solution. Dissolve 20.0 mg of *codergocrine mesilate CRS* in 10 ml of *acetonitrile R*. Add 10 ml of a 1.0 g/l solution of *phosphoric acid R* and dilute to 50.0 ml with *water R*. Dilute 6.0 ml of the solution to 50.0 ml with a mixture of 20 volumes of *acetonitrile R*, 20 volumes of a 1.0 g/l solution of *phosphoric acid R* and 60 volumes of *water R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent.

Mobile phase:

- mobile phase A: mix 100 volumes of *acetonitrile R* with 900 volumes of *water R* and add 10 volumes of *triethylamine R*,

- *mobile phase B*: mix 100 volumes of *water R* with 900 volumes of *acetonitrile R* and add 10 volumes of *triethylamine R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	75	25
5 - 20	75 → 25	25 → 75
20 - 22	25 → 75	75 → 25
22 - 30	75	25

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 10 µl.

Relative retention with reference to dihydroergocristine (retention time = about 13.7 min): impurity F = about 0.8; impurity H = about 0.9; impurity I = about 1.02.

System suitability: reference solution:

- the chromatogram shows 4 peaks,
- *resolution*: minimum 1 between the peaks corresponding to dihydroergocristine and impurity I.

Limits:

- *any impurity*: not more than the area of the peak corresponding to dihydroergocristine in the chromatogram obtained with the reference solution (1 per cent),
- *total*: not more than twice the area of the peak corresponding to dihydroergocristine in the chromatogram obtained with the reference solution (2 per cent),
- *disregard limit*: 0.1 times the area of the peak corresponding to dihydroergocristine in the chromatogram obtained with the reference solution (0.1 per cent).

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 0.500 g by drying under high vacuum at 80 °C.

ASSAY

Dissolve 0.300 g in 60 ml of *pyridine R*. Pass a stream of *nitrogen R* over the surface of the solution and titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20). Note the volume used at the second point of inflexion.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 35.39 mg of C₃₆H₄₅N₅O₈S.

STORAGE

Store protected from light.

IMPURITIES

- A. (6aR,9R,10aR)-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (6-methylergoline-8β-carboxamide),

- B. (6aR,9S,10aS)-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (6-methylisoergoline-8α-carboxamide),

- C. (6aR,9R,10aR)-N-[(2S,5S,10aS,10bS)-5-benzyl-10b-hydroxy-2-(1-methylethyl)-3,6-dioxooctahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (2'-epidihydroergocristine),

- D. R1 = CH(CH₃)₂, R2 = CH₃: (6aR,9R,10aR)-N-[(2R,5S,10aS,10bS)-10b-hydroxy-2-methyl-5-(1-methylethyl)-3,6-dioxooctahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (dihydroergosine),

- E. R1 = CH₂-C₆H₅, R2 = CH₃: (6aR,9R,10aR)-N-[(2R,5S,10aS,10bS)-5-benzyl-10b-hydroxy-2-methyl-3,6-dioxooctahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (dihydroergotamine),

- F. R1 = R2 = CH(CH₃)₂: (6aR,9R,10aR)-N-[(2R,5S,10aS,10bS)-10b-hydroxy-2,5-bis(1-methylethyl)-3,6-dioxooctahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (dihydroergocornine),

- G. R1 = CH₂-C₆H₅, R2 = CH₂-CH₃: (6aR,9R,10aR)-N-[(2R,5S,10aS,10bS)-5-benzyl-2-ethyl-10b-hydroxy-3,6-dioxooctahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide (dihydroergostine),

- L. (6a*R*,7*RS*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-5-benzyl-10b-hydroxy-2-(1-methylethyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide 7-oxide (dihydroergocristine 6-oxide).

01/2005:0551

DIHYDROERGOTAMINE MESILATE

Dihydroergotamini mesilas

 $C_{34}H_{41}N_5O_8S$ M_r 680

DEFINITION

(6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-5-Benzyl-10b-hydroxy-2-methyl-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide methanesulphonate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: slightly soluble in water, sparingly soluble in methanol, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- A. Dissolve 5.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Examined between 250 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 281 nm and 291 nm, and a shoulder at 275 nm. Above 320 nm the absorbance is negligible. The specific absorbance at the absorption maximum at 281 nm is 95 to 105 (dried substance).

- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *dihydroergotamine mesilate CRS*.

- C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- D. To 0.1 g add 5 ml of *dilute hydrochloric acid R* and shake for about 5 min. Filter and add 1 ml of *barium chloride solution RI*. The filtrate remains clear. Mix 0.1 g with 0.4 g of powdered *sodium hydroxide R*, heat to fusion and continue to heat for 1 min. Cool, add 5 ml of *water R*, boil and filter. Acidify the filtrate by the addition of *hydrochloric acid RI* and filter again. The filtrate gives reaction (a) of sulphates (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ or BY₇ (2.2.2, *Method II*).

Dissolve 0.10 g in a mixture of 0.1 ml of a 70 g/l solution of *methanesulphonic acid R* and 50 ml of *water R*.

pH (2.2.3): 4.4 to 5.4.

Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Specific optical rotation (2.2.7): −42 to −47 (dried substance).

Dissolve 0.250 g in *anhydrous pyridine R* and dilute to 25.0 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27). Prepare the reference solutions and the test solutions immediately before use and in the order indicated below.

Reference solution (a). Dissolve 10.0 mg of *dihydroergotamine mesilate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

01/2005:0600

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 50 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 5 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Plate: TLC silica gel *G* plate *R*.

Mobile phase: concentrated ammonia *R*, *methanol R*, *ethyl acetate R*, *methylene chloride R* (1:6:50:50 *V/V/V/V*).

Application: 5 µl.

Development: protected from light over a path of 15 cm. Dry the plate in a current of cold air for not longer than 1 min. Repeat the development protected from light over a path of 15 cm using a freshly prepared amount of the mobile phase.

Drying: in a current of cold air.

Detection: spray abundantly with *dimethylaminobenzaldehyde solution R7* and dry in a current of hot air for about 2 min.

Limits: test solution (a):

- **any impurity:** any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than 2 such spots are more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.2.32): maximum 4.0 per cent, determined on 0.500 g by drying at 100–105 °C at a pressure not exceeding 0.1 kPa for 5 h.

ASSAY

Dissolve 0.500 g in a mixture of 10 ml of *anhydrous acetic acid R* and 70 ml of *acetic anhydride R*. Titrate with 0.1 *M* *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* *perchloric acid* is equivalent to 68.00 mg of $C_{34}H_{41}N_5O_8S$.

STORAGE

Protected from light.

DIHYDROERGOTAMINE TARTRATE

Dihydroergotamini tartras

 $C_{70}H_{80}N_{10}O_{16}$
 M_r 1317

DEFINITION

Bis[(6a*R*,9*R*,10a*R*)-*N*[(2*R*,5*S*,10a*S*,10b*S*)-5-benzyl-10b-hydroxy-2-methyl-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide] (2*R*,3*R*)-2,3-dihydroxybutanedioate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: very slightly soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

A. Dissolve 5.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Examined between 250 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 281 nm and 291 nm, and a shoulder at 275 nm. Above 320 nm the absorbance is negligible. The specific absorbance at the maximum at 281 nm is 95 to 115 (dried substance).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *dihydroergotamine tartrate CRS*.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Suspend about 15 mg in 1 ml of *water R*. 0.1 ml of the suspension gives reaction (b) of tartrates (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_7 or BY_7 (2.2.2, *Method II*).

Dissolve 0.1 g in *alcohol* (85 per cent *V/V*) *R* warming carefully in a water-bath at 40 °C and dilute to 50 ml with the same solvent.

pH (2.2.3): 4.0 to 5.5 for the clear supernatant.

01/2005:0485

Suspend 50 mg in 50 ml of *carbon dioxide-free water R* and shake for 10 min. Allow to stand.

Specific optical rotation (2.2.7): -52 to -57 (dried substance).

Dissolve 0.250 g in *anhydrous pyridine R* and dilute to 25.0 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27). Prepare the reference solutions and the test solutions immediately before use and in the order indicated.

Reference solution (a). Dissolve 20 mg of *dihydroergotamine tartrate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 50 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 5 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Plate: TLC silica gel G plate *R*.

Mobile phase: concentrated ammonia *R*, methanol *R*, ethyl acetate *R*, methylene chloride *R* (1:6:50:50 V/V/V/V).

Application: 5 μ l.

Development: protected from light over a path of 15 cm. Dry the plate in a current of cold air for not longer than 1 min. Repeat the development protected from light over a path of 15 cm using a freshly prepared amount of the mobile phase.

Drying: in a current of cold air.

Detection: spray the plate abundantly with *dimethylaminobenzaldehyde solution R7* and dry in a current of hot air for about 2 min.

Limits: in the chromatogram obtained with test solution (a):

- **any impurity:** any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than 2 such spots are more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 0.200 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.05 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.05 M *perchloric acid* is equivalent to 32.93 mg of $C_{42}H_{88}N_{14}O_{36}S_3$.

STORAGE

Protected from light.

DIHYDROSTREPTOMYCIN SULPHATE FOR VETERINARY USE

Dihydrostreptomycini sulfas
ad usum veterinarium

 $C_{42}H_{88}N_{14}O_{36}S_3$
 M_r 1461

DEFINITION

Dihydrostreptomycin sulphate for veterinary use is bis[*N,N'*-bis(aminoiminomethyl)-4-*O*-[5-deoxy-2-*O*-[2-deoxy-2-(methylamino)- α -L-glucopyranosyl]-3-*C*-(hydroxymethyl)- α -L-lyxofuranosyl]-D-streptamine] tris(sulphate), the sulphate of a substance obtained by catalytic hydrogenation of streptomycin or by any other means. Stabilisers may be added. The potency is not less than 730 IU/mg, calculated with reference to the dried substance.

PRODUCTION

The method of manufacture is validated to demonstrate that the product if tested would comply with the following test:

Abnormal toxicity (2.6.9). Inject into each mouse 1 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

A white or almost white powder, freely soluble in water, practically insoluble in acetone, in alcohol and in methanol. It may be hygroscopic.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27) using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 ml of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *dihydrostreptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *dihydrostreptomycin sulphate CRS*, 10 mg of *kanamycin monosulphate CRS* and 10 mg of *neomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with a mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 150 °C for 5-10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

- B. Dissolve 0.1 g in 2 ml of *water R*, add 1 ml of α -*naphthol solution R* and 2 ml of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.
- C. Dissolve 10 mg in 5 ml of *water R* and add 1 ml of 1 M *hydrochloric acid*. Heat in a water-bath for 2 min. Add 2 ml of a 5 g/l solution of α -*naphthol R* in 1 M *sodium hydroxide* and heat in a water-bath for 1 min. A violet-pink colour is produced.
- D. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*). Allow to stand protected from light at a temperature of about 20 °C for 24 h; solution S is not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.200 g in *water R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is –83 to –91, calculated with reference to the dried substance.

Methanol. Not more than 0.2 per cent, determined by gas chromatography (2.2.28).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dilute 8.0 mg of *methanol R* to 100 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 1.5 m to 2.0 m long and 2.0 mm to 4.0 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (150-180 µm),
- *nitrogen for chromatography R* as the carrier gas at a constant flow rate of 30-40 ml/min,
- a flame-ionisation detector.

Maintain the column at a constant temperature between 120 °C and 140 °C and the injection port and the detector at a temperature at least 50 °C higher than that of the column. The area of the peak corresponding to methanol in the chromatogram obtained with the test solution is not greater than the area of the peak in the chromatogram obtained with the reference solution.

Streptomycin. Dissolve 0.100 g in *water R* and dilute to 5.0 ml with the same solvent. Add 5.0 ml of 0.2 M *sodium hydroxide* and heat in a water-bath for exactly 10 min. Cool in ice for exactly 5 min, add 3 ml of a 15 g/l solution of *ferric ammonium sulphate R* in 0.25 M *sulphuric acid*, dilute to 25.0 ml with *water R* and mix (test solution). Prepare at the same time and in the same manner a reference solution using 10 mg of *streptomycin sulphate CRS* in 50 ml of *water R*. Using 5.0 ml of this solution, operate as for the test solution. Exactly 20 min after addition of the ferric ammonium sulphate solution, measure the absorbance (2.2.25) of each solution at the maximum at 525 nm in a 2 cm cell, using as the compensation liquid a solution prepared at the same time and in the same manner as the test solution but omitting the substance to be examined. The absorbance of the test solution is not greater than that of the reference solution (1 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 4 h.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.0 g.

Sulphate. 18.0 per cent to 21.5 per cent of sulphate (SO₄), calculated with reference to the dried substance. Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate*, adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of sulphate (SO₄).

Bacterial endotoxins (2.6.14): less than 0.50 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, the name and quantity of any added stabiliser,
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:1004

DILTIAZEM HYDROCHLORIDE**Diltiazemi hydrochloridum** $C_{22}H_{27}ClN_2O_4S$ M_r 451.0**DEFINITION**

Diltiazem hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*S*,3*S*)-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, in methanol and in methylene chloride, slightly soluble in ethanol. It melts at about 213 °C with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diltiazem hydrochloride CRS*. Examine the substances prepared as discs.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.10 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *diltiazem hydrochloride CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *acetic acid R*, 3 volumes of *water R*, 10 volumes of *methylene chloride R* and 12 volumes of *ethanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 50 mg in 5 ml of *water R*. Add 1 ml of *ammonium reineckate solution R*. A pink precipitate is produced.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.00 g in *carbon-dioxide free water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 2.0 ml of solution S to 10.0 ml with *carbon dioxide-free water R*. The pH of the solution is 4.3 to 5.3.

Specific optical rotation (2.2.7). Dilute 5.0 ml of solution S to 25.0 ml with *water R*. The specific optical rotation is + 115 to + 120, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution(a). Dissolve 50.0 mg of *diltiazem hydrochloride CRS* in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 3 mg of *diltiazem impurity A CRS* in the mobile phase and dilute to 10 ml with the mobile phase. To 1 ml of this solution, add 1.2 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Reference solution(c). Dilute 0.3 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 5 volumes of *ethanol R*, 25 volumes of *acetonitrile R* and 70 volumes of a solution containing, in 1 litre, 6.8 g of *potassium dihydrogen phosphate R* and 0.1 ml of *N,N-dimethyloctylamine R*, adjusted to pH 4.5 using *dilute phosphoric acid R*,
- as detector a spectrophotometer set at 240 nm,
- a loop injector.

Inject separately 20 µl of each solution. Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (c) is at least 10 per cent of the full scale of the recorder. Continue the chromatography for five times the retention time of the principal peak. The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the peaks due to diltiazem impurity A and diltiazem is at least 4.0 and the symmetry factors are not more than 2.0. If necessary, adjust the concentration of *N,N-dimethyloctylamine* in the mobile phase. In the chromatogram obtained with the test solution, the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent). Disregard any peak with an area less than 0.025 times that of the peak in the chromatogram obtained with reference solution (c).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20.0 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in a mixture of 2 ml of *anhydrous formic acid R* and 60 ml of *acetic anhydride R* and titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 45.1 mg of $C_{22}H_{27}ClN_2O_4S$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. (2*R*,3*S*)-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate,

- B. R1 = CO-CH₃, R2 = H, R3 = OCH₃: (2*S*,3*S*)-2-(4-methoxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate,
 C. R1 = CO-CH₃, R2 = CH₂-CH₂-N(CH₃)₂, R3 = OH: (2*S*,3*S*)-5-[2-(dimethylamino)ethyl]-2-(4-hydroxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate,
 D. R1 = CO-CH₃, R2 = CH₂-CH₂-NH-CH₃, R3 = OCH₃: (2*S*,3*S*)-2-(4-methoxyphenyl)-5-[2-(methylamino)ethyl]-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate,
 E. R1 = R2 = H, R3 = OCH₃: (2*S*,3*S*)-3-hydroxy-2-(4-methoxyphenyl)-2,3-dihydro-1,5-benzothiazepin-4(5*H*)-one,
 F. R1 = H, R2 = CH₂-CH₂-N(CH₃)₂, R3 = OCH₃: (2*S*,3*S*)-5-[2-(dimethylamino)ethyl]-3-hydroxy-2-(4-methoxyphenyl)-2,3-dihydro-1,5-benzothiazepin-4(5*H*)-one.

01/2005:0601

DIMENHYDRINATE

Dimenhydrinatum

C₂₄H₂₈ClN₅O₃M_r 470.0

DEFINITION

Dimenhydrinate contains not less than 53.0 per cent and not more than 55.5 per cent of diphenhydramine [2-(diphenylmethoxy)-*N,N*-dimethylethylamine, C₁₇H₂₁NO, M_r 255.4] and not less than 44.0 per cent and not more than 46.5 per cent of 8-chlorotheophylline (8-chloro-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione, C₇H₇ClN₄O₂, M_r 214.6), both calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, slightly soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- A. Melting point (2.2.14): 102 °C to 106 °C.
 B. Dissolve 0.1 g in a mixture of 3 ml of *water R* and 3 ml of *alcohol R*, add 6 ml of *water R* and 1 ml of *dilute hydrochloric acid R* and cool in iced water for 30 min, scratching the wall of the tube with a glass rod if necessary to initiate crystallisation. Dissolve about 10 mg of the precipitate obtained in 1 ml of *hydrochloric acid R*, add 0.1 g of *potassium chlorate R* and evaporate to dryness in a porcelain dish. A reddish residue is obtained which becomes violet-red when exposed to ammonia vapour.
 C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dimenhydrinate CRS*.
 D. Dissolve 0.2 g in 10 ml of *alcohol R*. Add 10 ml of *picric acid solution R* and initiate crystallisation by scratching the wall of the tube with a glass rod. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 130 °C to 134 °C.

TESTS

Appearance of solution. Dissolve 1.0 g in *alcohol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). To 0.4 g add 20 ml of *carbon dioxide-free water R*, shake for 2 min and filter. The pH of the filtrate is 7.1 to 7.6.

Theophylline and substances related to diphenhydramine. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.40 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *theophylline R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 5 ml of the test solution to 100 ml with *methylene chloride R*. Dilute 10 ml of this solution to 100 ml with *methylene chloride R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 9 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Dry the plate in a current of cold air and examine in ultraviolet light at 254 nm. Any spot corresponding to theophylline in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). Spray with *potassium iodobismuthate solution R*. Allow the plate to dry in air and spray with *dilute hydrogen peroxide solution R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any spot extending from the starting point to an *R_f* of about 0.1.

Heavy metals (2.4.8). Dissolve 2.5 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 25 ml with the same mixture of solvents. The solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Diphenhydramine. Dissolve 0.200 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.54 mg of $C_{17}H_{21}NO$.

8-Chlorotheophylline. To 0.800 g add 50 ml of *water R*, 3 ml of *dilute ammonia R1* and 0.6 g of *ammonium nitrate R* and heat on a water-bath for 5 min. Add 25.0 ml of 0.1 M *silver nitrate* and continue heating on a water-bath for 15 min with frequent swirling. Cool, add 25 ml of *dilute nitric acid R* and dilute to 250.0 ml with *water R*. Filter and discard the first 25 ml of the filtrate. Using 5 ml of *ferric ammonium sulphate solution R2* as indicator, titrate 100.0 ml of the filtrate with 0.1 M *ammonium thiocyanate* until a yellowish-brown colour is obtained.

1 ml of 0.1 M *silver nitrate* is equivalent to 21.46 mg of $C_7H_7ClN_4O_2$.

01/2005:0389

DIMERCAPROL

Dimercaprolum

 $C_3H_8OS_2$ M_r 124.2

DEFINITION

Dimercaprol contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (2*RS*)-2,3-disulfanylmethylpropan-1-ol.

CHARACTERS

A clear, colourless or slightly yellow liquid, soluble in water and in arachis oil, miscible with alcohol and with benzyl benzoate.

IDENTIFICATION

- Dissolve 0.05 ml in 2 ml of *water R*. Add 1 ml of 0.05 M *iodine*. The colour of the iodine is discharged immediately.
- Dissolve 0.1 ml in 5 ml of *water R* and add 2 ml of *copper sulphate solution R*. A bluish-black precipitate is formed which quickly becomes dark grey.
- In a ground-glass-stoppered tube, suspend 0.6 g of *sodium bismuthate R*, previously heated to 200 °C for 2 h, in a mixture of 2.8 ml of *dilute phosphoric acid R* and 6 ml of *water R*. Add 0.2 ml of the substance to be examined, mix and allow to stand for 10 min with frequent shaking. To 1 ml of the supernatant liquid add 5 ml of a 4 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* and mix. Heat for 15 min in a water-bath. A violet-red colour develops.

TESTS

Appearance. It is clear (2.2.1) and not more intensely coloured than reference solution B₆ or BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Add 0.25 ml of *bromocresol green solution R* and 0.3 ml of 0.01 M *hydrochloric acid*. The solution is yellow. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Refractive index (2.2.6): 1.568 to 1.574.

Halides. To 2.0 g add 25 ml of *alcoholic potassium hydroxide solution R* and boil under a reflux condenser for 2 h. Eliminate the alcohol by evaporation in a stream of hot air, add 20 ml of *water R* and cool. Add 40 ml of *water R* and 10 ml of *strong hydrogen peroxide solution R*, boil gently for 10 min, cool and filter rapidly. Add 10 ml of *dilute nitric acid R* and 5.0 ml of 0.1 M *silver nitrate*. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with 0.1 M *ammonium thiocyanate* until a reddish-yellow colour is obtained. Carry out a blank titration. The difference between the titration volumes is not greater than 1.0 ml.

ASSAY

Dissolve 0.100 g in 40 ml of *methanol R*. Add 20 ml of 0.1 M *hydrochloric acid* and 50.0 ml of 0.05 M *iodine*. Allow to stand for 10 min and titrate with 0.1 M *sodium thiosulphate*. Carry out a blank titration.

1 ml of 0.05 M *iodine* is equivalent to 6.21 mg of $C_3H_8OS_2$.

STORAGE

Store in a well-filled, airtight container, protected from light, at a temperature of 2 °C to 8 °C.

01/2005:0763

DIMETHYL SULFOXIDE

Dimethylis sulfoxidum

 C_2H_6OS M_r 78.1

DEFINITION

Dimethyl sulfoxide is sulphinylbismethane.

CHARACTERS

A colourless liquid or colourless crystals, hygroscopic, miscible with water and with alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- It complies with the test for relative density (see Tests).
- It complies with the test for refractive index (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dimethyl sulfoxide CRS*.
- Dissolve 50 mg of *nickel chloride R* in 5 ml of the substance to be examined. The solution is greenish-yellow. Heat in a water-bath at 50 °C. The colour changes to green or bluish-green. Cool. The colour changes to greenish-yellow.

TESTS

Acidity. Dissolve 50.0 g in 100 ml of *carbon dioxide-free water R*. Add 0.1 ml of *phenolphthalein solution R1*. Not more than 5.0 ml of 0.01 M *sodium hydroxide* is required to produce a pink colour.

Relative density (2.2.5): 1.100 to 1.104.

Refractive index (2.2.6): 1.478 to 1.479.

Freezing point (2.2.18). Not less than 18.3 °C.

Absorbance (2.2.25). Purge with *nitrogen R* for 15 min. The absorbance, measured using *water R* as the compensation liquid, is not more than 0.30 at 275 nm and not more than 0.20 at both 285 nm and 295 nm. Examined between 270 nm and 350 nm, the substance to be examined shows no absorption maximum.

Related substances. Examine by gas chromatography (2.2.28), using *bibenzyl R* as the internal standard.

Internal standard solution. Dissolve 0.125 g of *bibenzyl R* in *acetone R* and dilute to 50 ml with the same solvent.

Test solution (a). Dissolve 5.0 g of the substance to be examined in *acetone R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 5.0 g of the substance to be examined in *acetone R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *acetone R*.

Reference solution. Dissolve 50.0 mg of the substance to be examined and 50 mg of *dimethyl sulphone R* in *acetone R*, add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *acetone R*.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m long and 4 mm in internal diameter, packed with *diatomaceous earth for gas chromatography R* (125 µm to 180 µm) impregnated with 10 per cent *m/m* of *polyethyleneglycol adipate R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 165 °C and that of the injection port and of the detector at 190 °C.

Inject 1 µl of the reference solution and adjust the sensitivity of the system so that the heights of the three peaks, apart from the solvent peak, are not less than 70 per cent of the full scale of the recorder. The substances elute in the following order: dimethyl sulfoxide, dimethyl sulphone, bibenzyl. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks due to dimethyl sulfoxide and dimethyl sulphone is at least 3.

Inject 1 µl of test solution (a). In the chromatogram obtained, verify that there is no peak with the same retention time as the internal standard.

Inject 1 µl of test solution (b) and 1 µl of the reference solution. Continue the chromatography for four times the retention time of dimethyl sulfoxide, which is about 5 min. From the chromatogram obtained with the reference solution, calculate the ratio (*R*) of the area of the peak due to dimethyl sulfoxide to the area of the peak due to the internal standard. From the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of any peaks, apart from the principal peak, the peak due to the internal standard and the peak due to the solvent, to the area of the peak due to the internal standard; this ratio is not greater than *R* (0.1 per cent).

Water (2.5.12). Not more than 0.2 per cent, determined on 10.0 g by the semi-micro determination of water.

STORAGE

Store in an airtight, glass container, protected from light.

01/2005:1667

DIMETHYLACETAMIDE

Dimethylacetamidum

C_4H_9NO

M_r 87.1

DEFINITION

N,N-Dimethylacetamide.

CHARACTERS

Appearance: clear, colourless, slightly hygroscopic liquid.

Solubility: miscible with water, with alcohol, and with most common organic solvents.

bp: about 165 °C.

IDENTIFICATION

First identification: *C*.

Second identification: *A, B, D*.

A. Relative density (2.2.5): 0.941 to 0.944.

B. Refractive index (2.2.6): 1.435 to 1.439.

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: films.

Comparison: *dimethylacetamide CRS*.

D. Dilute 50 mg with 1 ml of *methanol R*. Add 1 ml of a 15 g/l solution of *hydroxylamine hydrochloride R* and mix. Add 1 ml of *dilute sodium hydroxide solution R*, mix and allow to stand for 30 min. Add 1 ml of *dilute hydrochloric acid R* and add 1 ml of a 100 g/l solution of *ferric chloride R* in 0.1 *M* *hydrochloric acid*. A reddish-brown colour develops, reaching a maximum intensity after about 5 min.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution *Y*₇ (2.2.2, *Method II*).

Acidity. Dilute 50 ml with 50 ml of *water R* previously adjusted with 0.02 *M* *potassium hydroxide* or 0.02 *M* *hydrochloric acid* to a bluish-green colour, using 0.5 ml of *bromothymol blue solution R1* as indicator. Not more than 5.0 ml of 0.02 *M* *potassium hydroxide* is required to restore the initial (bluish-green) colour.

Alkalinity. To 50 ml add 50 ml of *water R* previously adjusted with 0.02 *M* *potassium hydroxide* or 0.02 *M* *hydrochloric acid* to a yellow colour, using 0.5 ml of *bromothymol blue solution R1* as indicator. Titrate with 0.02 *M* *hydrochloric acid*. Not more than 0.5 ml of 0.02 *M* *hydrochloric acid* is required to restore the initial (yellow) colour.

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dilute a mixture of 1 ml of the substance to be examined and 1 ml of *dimethylformamide R* to 20 ml with *methylene chloride R*.

Reference solution (b). Dilute 1 ml of the substance to be examined to 20.0 ml with *methylene chloride R*. Dilute 0.1 ml of the solution to 10.0 ml with *methylene chloride R*.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 1 μ m).

Carrier gas: nitrogen for chromatography R.

Linear velocity: 30 cm/s.

Split ratio: 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	80 → 200
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 0.5 μ l.

System suitability:

- *resolution*: minimum 5.0 between the peaks due to dimethylacetamide and dimethylformamide in the chromatogram obtained with reference solution (a),
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

- *any impurity*: maximum 0.1 per cent,
- *total*: maximum 0.3 per cent,
- *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

Dilute 4.0 g to 20.0 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Non-volatile matter: maximum 20 ppm.

Evaporate 50 g to dryness using a rotary evaporator at a pressure not exceeding 1 kPa and on a water-bath. Dry the residue in an oven at 170–175 °C. The residue weighs not more than 1 mg.

Water (2.5.32): maximum 0.1 per cent, determined on 0.100 g.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. acetic acid,

B. R = H: *N,N*-dimethylformamide,

C. R = C₂H₅: *N,N*-dimethylpropanamide,

D. R = CH₂-CH₂-CH₃: *N,N*-dimethylbutanamide.

DIMETICONE

Dimeticonum

DEFINITION

Dimeticone is a poly(dimethylsiloxane) obtained by hydrolysis and polycondensation of dichlorodimethylsilane and chlorotrimethylsilane. Different grades exist which are distinguished by a number indicating the nominal viscosity placed after the name.

Their degree of polymerisation ($n = 20$ to 400) is such that their kinematic viscosities are nominally between 20 mm²s^{−1} and 1300 mm²s^{−1}.

Dimeticones with a nominal viscosity of 50 mm²s^{−1} or lower are intended for external use only.

CHARACTERS

Clear, colourless liquids of various viscosities, practically insoluble in water, very slightly soluble to practically insoluble in ethanol, miscible with ethyl acetate, with methyl ethyl ketone and with toluene.

IDENTIFICATION

- It is identified by its kinematic viscosity at 25 °C (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *dimeticone CRS*. The region of the spectrum from 850 cm^{−1} to 750 cm^{−1} is not taken into account.
- Heat 0.5 g in a test-tube over a small flame until white fumes begin to appear. Invert the tube over a 2nd tube containing 1 ml of a 1 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* so that the fumes reach the solution. Shake the 2nd tube for about 10 s and heat on a water-bath for 5 min. The solution is violet.
- In a platinum crucible, prepare the sulphated ash (2.4.14) using 50 mg. The residue is a white powder that gives the reaction of silicates (2.3.1).

TESTS

Acidity. To 2.0 g add 25 ml of a mixture of equal volumes of *ethanol R* and *ether R*, previously neutralised to 0.2 ml of *bromothymol blue solution R1* and shake. Not more than 0.15 ml of 0.01 M *sodium hydroxide* is required to change the colour of the solution to blue.

Viscosity (2.2.9). Determine the kinematic viscosity at 25 °C. For dimeticones, the kinematic viscosity is not less than 90 per cent and not more than 110 per cent of the nominal viscosity stated on the label.

Mineral oils. Place 2 g in a test-tube and examine in ultraviolet light at 365 nm. The fluorescence is not more intense than that of a solution containing 0.1 ppm of *quinine sulphate R* in 0.005 M *sulphuric acid* examined in the same conditions.

Phenylated compounds. Dissolve 5.0 g with shaking in 10 ml of *cyclohexane R*. At wavelengths from 250 nm to 270 nm, the absorbance (2.2.25) of the solution is not greater than 0.2.

Heavy metals. Mix 1.0 g with *methylene chloride R* and dilute to 20 ml with the same solvent. Add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *water R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. At the same time, prepare a standard as follows: to 20 ml of *methylene chloride R* add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *lead standard solution (10 ppm Pb) R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. Immediately shake each solution vigorously for 1 min. Any red colour in the test solution is not more intense than that in the standard (5 ppm).

Volatile matter. For dimeticones with a nominal viscosity greater than 50 mm²s⁻¹, not more than 0.3 per cent, determined on 1.00 g by heating in an oven at 150 °C for 2 h. Carry out the test using a dish 60 mm in diameter and 10 mm deep.

LABELLING

The label states:

- the nominal viscosity by a number placed after the name of the product,
- where applicable, that the product is intended for external use.

01/2005:1417

DIMETINDENE MALEATE

Dimetindeni maleas

C₂₄H₂₈N₂O₄

*M*_r 408.5

DEFINITION

Dimetindene maleate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N,N*-dimethyl-2-[3-[(*RS*)-1-(pyridin-2-yl)ethyl]-1*H*-inden-2-yl]ethanamine (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white to almost white, crystalline powder, slightly soluble in water, soluble in methanol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dimetindene maleate CRS*. Examine the substance prepared as discs.

TESTS

Solution S. Dissolve 0.20 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than Y₆ (2.2.2, *Method II*).

Optical rotation (2.2.7). Determined on solution S, the angle of optical rotation is −0.10° to + 0.10°.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of equal volumes of *acetone R* and *methylene chloride R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 100.0 ml with a mixture of equal volumes of *acetone R* and *methylene chloride R*.

Reference solution (b). Dissolve 5.0 mg of 2-ethylpyridine *R* in a mixture of equal volumes of *acetone R* and *methylene chloride R* and dilute to 50.0 ml with the same mixture of solvents. Dilute 10.0 ml of this solution to 100.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.32 mm in internal diameter coated with *polymethylphenylsiloxane R* (film thickness 0.25 µm),
- *helium for chromatography R* as the carrier gas at a linear velocity of about 30 cm/s,
- a flame-ionisation detector,

maintaining the temperature of the column at 60 °C for 1 min, then raising the temperature at a rate of 6 °C/min to 260 °C and maintaining at 260 °C for 12 min. Maintain the temperature of the injection port at 240 °C and that of the detector at 260 °C.

Inject via a split injector with a split flow of 30 ml/min for 1.3 times the retention time of the principal peak.

Inject 2 µl of reference solution (a). The symmetry factor of the principal peak in the chromatogram obtained is not greater than 1.3.

Inject 2 µl of the test solution and 2 µl of reference solution (b). In the chromatogram obtained with the test solution the area of the peak corresponding to 2-ethylpyridine is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak and any peak appearing during the first 8 min (2-ethylpyridine, the solvent mixture and maleic acid), is not greater than 0.2 times the area of the peak in the chromatogram with reference solution (a) (0.2 per cent) and the sum of the areas of all peaks is not greater than 0.5 times the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (a).

Loss on drying (2.2.32). Not more than 0.1 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 20.43 mg of C₂₄H₂₈N₂O₄.

STORAGE

Store protected from light.

IMPURITIES

01/2005:1312

A. 2-ethylpyridine,

B. 2-(1*H*-inden-2-yl)-*N,N*-dimethylethanamine,C. R = C₂H₅: ethyl (2*RS*)-2-benzyl-4-(dimethylamino)butanoate,D. R = H: (2*RS*)-2-benzyl-4-(dimethylamino)butanoic acid,E. DINOPROST TROMETAMOL

Dinoprostum trometamolum

C₂₄H₄₅NO₈M_r 475.6

DEFINITION

Dinoprost trometamol contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of trometamol (*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(*E*)-(3*S*)-3-hydroxyoct-1-enyl]cyclopentyl]hept-5-enoate (PGF_{2α}), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, very soluble in water, freely soluble in alcohol, practically insoluble in acetonitrile.

IDENTIFICATION

A. Dissolve 0.100 g in *alcohol R* and dilute to 10.0 ml with the same solvent. The specific optical rotation (2.2.7) is + 19 to + 26, calculated with reference to the anhydrous substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dinoprost trometamol CRS*.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 23 volumes of *acetonitrile R* and 77 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). *Degradation of dinoprost trometamol to impurity B.* Dissolve 1 mg of the substance to be examined in 1 ml of the mobile phase and heat the solution on a water-bath at 85 °C for 5 min and cool.

Reference solution (b). Dilute 2.0 ml of the test solution to 20.0 ml with a mixture of 23 volumes of *acetonitrile R* and 77 volumes of *water R*. Dilute 2.0 ml of the solution to 20.0 ml with a mixture of 23 volumes of *acetonitrile R* and 77 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R1* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: dissolve 2.44 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000 ml with *water R*; adjust the pH to 2.5 with *phosphoric acid R* (about 0.6 ml); mix 770 ml of the buffer solution with 230 ml of *acetonitrile R1*,
- as detector a spectrophotometer set at 200 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is 25 per cent to 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: (15*R*)-PGF_{2α} (impurity B) about 55 min; 5,6-*trans*-PGF_{2α} (impurity A) about 60 min and dinoprost about 66 min. Continue the chromatography for 2.5 times the retention time of the principal peak (to elute degradation products formed during heating). The test is not valid unless the resolution between the peaks corresponding to impurity A and impurity B is at least 1.5 and the resolution between the peaks corresponding to impurity A and dinoprost is at least 2.0; the symmetry factor for the peaks corresponding to impurity A and impurity B is less than 1.2. If necessary, adjust the composition of the mobile phase by increasing the concentration of acetonitrile to decrease the retention times.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography of the test solution for 10 min after the elution of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to impurity A is not greater than twice the area of the principal peak obtained with reference solution (b) (2 per cent); the area of any other peak, apart from the principal peak and any peak corresponding to impurity A, is not greater than 1.5 times the area of the principal peak obtained with reference solution (b) (1.5 per cent) and not more than one such peak has an area greater than half the area of the principal peak obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the peaks, apart from the principal peak and the peak corresponding to impurity A, is not greater than twice the area of the principal peak obtained with reference solution (b) (2 per cent). Disregard any peak due to the mobile phase and any peak due to trometamol (retention time about 1.5 min) and also any peak with an area of less than 0.05 times the area of the principal peak obtained with reference solution (b).

Water (2.5.12). Not more than 1.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 23 volumes of *acetonitrile R* and 77 volumes of *water R* and dilute to 10.0 ml with the same mixture.

Reference solution. Dissolve 10.0 mg of *dinoprost trometamol CRS* in a mixture of 23 volumes of *acetonitrile R* and 77 volumes of *water R* and dilute to 10.0 ml with the same mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R1* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: dissolve 2.44 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000 ml with *water R*; adjust the pH to 2.5 with *phosphoric acid R* (about 0.6 ml); mix 730 ml of the buffer solution with 270 ml of *acetonitrile R1*,
- as detector a spectrophotometer set at 200 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of the reference solution is 70 per cent to 90 per cent of the full scale of the recorder. When the chromatogram is recorded under the conditions described above, the retention time is about 23 min for dinoprost.

Inject the reference solution six times. The test is not valid unless the relative standard deviation of the peak area for dinoprost is at most 2.0 per cent. Inject 20 µl of the test solution. Calculate the percentage of dinoprost trometamol.

IMPURITIES

- A. (*E*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(*E*)-(3*S*)-3-hydroxyoct-1-enyl]cyclopentyl]hept-5-enoic acid ((5*E*)-PGF_{2α}; 5,6-*trans*-PGF_{2α}),

- B. (*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(*E*)-(3*R*)-3-hydroxyoct-1-enyl]cyclopentyl]hept-5-enoic acid ((15*R*)-PGF_{2α}; 15-*epi*PGF_{2α}),

- C. (*Z*)-7-[(1*S*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(*E*)-(3*S*)-3-hydroxyoct-1-enyl]cyclopentyl]hept-5-enoic acid ((8*S*)-PGF_{2α}; 8-*epi*PGF_{2α}),

- D. (*Z*)-7-[(1*R*,2*R*,3*S*,5*S*)-3,5-dihydroxy-2-[(*E*)-(3*S*)-3-hydroxyoct-1-enyl]cyclopentyl]hept-5-enoic acid (11β-PGF_{2α}; 11-*epi*PGF_{2α}).

01/2005:1311

DINOPROSTONE

Dinoprostonium

C₂₀H₃₂O₅

M_r 352.5

DEFINITION

(*Z*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*)-(3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (PGE₂).

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, very soluble in methanol, freely soluble in alcohol.

The substance degrades at room temperature.

IDENTIFICATION

A. Specific optical rotation (2.2.7): -82 to -90 (anhydrous substance).

Immediately before use, dissolve 50.0 mg in *alcohol R* and dilute to 10.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *dinoprostone CRS*.

TESTS

Prepare the solutions immediately before use.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 10.0 mg of the substance to be examined in a 58 per cent *V/V* solution of *methanol R2* and dilute to 2.0 ml with the same solvent.

Test solution (b). Dissolve 20.0 mg of the substance to be examined in a 58 per cent *V/V* solution of *methanol R2* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 1 mg of *dinoprostone CRS* and 1 mg of *dinoprostone impurity C CRS* in a 58 per cent *V/V* solution of *methanol R2* and dilute to 10.0 ml with the same solvent. Dilute 4.0 ml of the solution to 10.0 ml with a 58 per cent *V/V* solution of *methanol R2*.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 10.0 ml with a 58 per cent *V/V* solution of *methanol R2*. Dilute 1.0 ml of the solution to 10.0 ml with a 58 per cent *V/V* solution of *methanol R2*.

Reference solution (c). In order to prepare *in situ* the degradation compounds (impurity D and impurity E), dissolve 1 mg of the substance to be examined in 100 μ l of 1 M *sodium hydroxide* (the solution becomes brownish-red), wait 4 min, add 150 μ l of 1 M *acetic acid* (yellowish-white opalescent solution) and dilute to 5.0 ml with a 58 per cent *V/V* solution of *methanol R2*.

Reference solution (d). Dissolve 20 mg of *dinoprostone CRS* in a 58 per cent *V/V* solution of *methanol R2* and dilute to 20.0 ml with the same solvent.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** end-capped octadecylsilyl silica gel for chromatography *R*,
- **temperature:** 30 °C.

Mobile phase: mix 42 volumes of a 0.2 per cent *V/V* solution of *acetic acid R* and 58 volumes of *methanol R2*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 μ l; inject test solution (a) and reference solutions (a), (b) and (c).

Relative retention with reference to *dinoprostone* (retention time = about 18 min): impurity C = about 1.2; impurity D = about 1.8; impurity E = about 2.0.

System suitability: reference solution (a):

- **resolution:** minimum of 3.8 between the peaks due to *dinoprostone* and to impurity C. If necessary adjust the concentration of the acetic acid solution and/or methanol (increase the concentration of the acetic acid solution

to increase the retention time for *dinoprostone* and impurity C and increase the concentration of methanol to decrease the retention time for both compounds).

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.2; impurity E = 0.7,
- **impurity C:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- **impurity D:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **impurity E:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total of other impurities:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

If any peak with a relative retention to *dinoprostone* of about 0.8 is greater than 0.5 per cent or if the total of other impurities is greater than 1.0 per cent, record the chromatogram of test solution (a) with a detector set at 230 nm. If the area of the peak at 230 nm is twice the area of the peak at 210 nm, multiply the area at 210 nm by 0.2 (correction factor for impurity F).

Water (2.5.12): maximum 0.5 per cent, determined on 0.50 g.

ASSAY

Prepare the solutions immediately before use.

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution (b) and reference solution (d).

Calculate the percentage content of $C_{20}H_{32}O_5$.

STORAGE

At a temperature not exceeding -15 °C.

IMPURITIES

A. (Z)-7-[(1R,2R,3R)-3-hydroxy-2-[(E)-(3R)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (15-epiPGE₂; (15R)-PGE₂),

B. (Z)-7-[(1S,2R,3R)-3-hydroxy-2-[(E)-(3S)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (8-epiPGE₂; (8S)-PGE₂),

- C. (E)-7-[(1R,2R,3R)-3-hydroxy-2-[(E)-(3S)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (5-*trans*-PGE₂; (5*E*)-PGE₂),

- D. (Z)-7-[(1R,2S)-2-[(E)-(3S)-3-hydroxyoct-1-enyl]-5-oxocyclopent-3-enyl]hept-5-enoic acid (PGA₂),

- F. (Z)-7-[(1R,2R,3R)-3-hydroxy-2-[(E)-3-oxooct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (15-oxo-PGE₂; 15-keto-PGE₂).

01/2005:1611

DIOSMIN

Diosminum

C₂₈H₃₂O₁₅M_r 609

DEFINITION

7-[6-O-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4H-1-benzopyran-4-one.

Substance obtained through iodine-assisted oxidation of (2*S*)-7-[6-O-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-2,3-dihydro-4*H*-1-benzopyran-4-one (hesperidin) of natural origin.

Content: 90.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: greyish-yellow or light yellow hygroscopic powder.

Solubility: practically insoluble in water, soluble in dimethyl sulphoxide, practically insoluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *diosmin CRS*.

- B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Iodine: maximum 0.1 per cent.

Determine the total content of iodine by potentiometry, using an iodide-selective electrode (2.2.36), after oxygen combustion (2.5.10).

Test solution. Wrap 0.100 g of the substance to be examined in a piece of filter paper and place it in a sample carrier. Introduce into the flask 50 ml of a 0.2 g/l solution of *hydrazine R*. Flush the flask with oxygen for 10 min. Ignite the filter paper. Stir the contents of the flask immediately after the end of the combustion to dissolve completely the combustion products. Continue stirring for 1 h.

Reference solution. Dilute 2.0 ml of a 16.6 g/l solution of *potassium iodide R* to 100.0 ml with *water R*. Dilute 10.0 ml of the solution to 100.0 ml with *water R*.

Introduce into a beaker 30 ml of a 200 g/l solution of *potassium nitrate R* in 0.1 *M nitric acid*. Immerse the electrodes and stir for 10 min. The potential of the solution (*nT*₁) must remain stable. Add 1 ml of the test solution and measure the potential (*nT*₂).

Introduce into a beaker 30 ml of a 200 g/l solution of *potassium nitrate R* in 0.1 *M nitric acid*. Immerse the electrodes and stir for 10 min. The potential of the solution must remain stable (*nR*₁). Add 80 µl of the reference solution and measure the potential (*nR*₂).

The absolute value |*nT*₂ - *nT*₁| is not higher than the absolute value |*nR*₂ - *nR*₁|.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dimethyl sulphoxide R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 25.0 mg of *diosmin CRS* in *dimethyl sulphoxide R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with *dimethyl sulphoxide R*.

Reference solution (c). Dissolve 5.0 mg of *diosmin for system suitability CRS* in *dimethyl sulphoxide R* and dilute to 5.0 ml with the same solvent.

Column:

- **size:** *l* = 0.10 m, Ø = 4.6 mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (3 µm),
- **temperature:** 40 °C.

Mobile phase: acetonitrile *R*, glacial acetic acid *R*, methanol *R*, water *R* (2:6:28:66 V/V/V/V).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 10 µl loop injector; inject the test solution and reference solutions (b) and (c).

Run time: 6 times the retention time of diosmin.

Relative retention with reference to diosmin (retention time = about 4.6 min): impurity A = about 0.5, impurity B = about 0.6, impurity C = about 0.8, impurity D = about 2.2, impurity E = about 2.6, impurity F = about 4.5.

System suitability: reference solution (c):

- **resolution:** minimum of 2.5 between the peaks due to impurities B and C.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.38; impurity F = 0.61,
- **impurity A:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent),
- **impurity C:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent),
- **impurity E:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent),
- **impurity F:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent),
- **any other impurity:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **total of other impurities and impurity A:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (10 per cent),
- **disregard limit:** 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

2.0 g complies with limit test C. Prepare the standard using 4.0 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 6.0 per cent, determined on 0.300 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29), as described in the test for related substances.

Injection: test solution and reference solution (a).

STORAGE

In an airtight container.

IMPURITIES

IMPURITIES

Specified impurities: A, B, C, D, E.

- A. $R = R' = H$: 2-(diphenylmethoxy)-*N*-methylethanamine,
 B. $R = R' = CH_3$: 2-[(*RS*)-(4-methylphenyl)phenylmethoxy]-*N,N*-dimethylethanamine,
 C. $R = Br, R' = CH_3$: 2-[(*RS*)-(4-bromophenyl)phenylmethoxy]-*N,N*-dimethylethanamine,

- D. $R = OH, R' = H$: diphenylmethanol (benzhydrol),
 E. $R + R' = O$: diphenylmethanone (benzophenone).

01/2005:0819

DIPHENOXYLATE HYDROCHLORIDE

Diphenoxylati hydrochloridum

 $C_{30}H_{33}ClN_2O_2$ M_r 489.1

DEFINITION

Diphenoxylate hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of ethyl 1-(3-cyano-3,3-diphenylpropyl)-4-phenylpiperidine-4-carboxylate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

It melts at about 220 °C, with decomposition.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur.* reference spectrum of diphenoxylate hydrochloride.

- B. Dissolve about 30 mg in 5 ml of *methanol R*. Add 0.25 ml of *nitric acid R* and 0.4 ml of *silver nitrate solution R1*. Shake and allow to stand. A curdled precipitate is formed. Centrifuge and rinse the precipitate with three quantities, each of 2 ml, of *methanol R*. Carry out this operation rapidly and protected from bright light. Suspend the precipitate in 2 ml of *water R* and add 1.5 ml of *ammonia R*. The precipitate dissolves easily.

TESTS

Appearance of solution. Dissolve 1.0 g in *methylene chloride R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using a plate coated with a suitable octadecylsilyl silica gel (5 µm) with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 1.0 g in a mixture of 1 volume of *methanol R* and 2 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dilute 0.5 ml of the test solution to 100 ml with a mixture of 1 volume of *methanol R* and 2 volumes of *methylene chloride R*.

Reference solution (b). Dissolve 0.50 g of the substance to be examined in 25 ml of a 15 g/l solution of *potassium hydroxide R* in *methanol R* and add 1 ml of *water R*. Heat on a water-bath under a reflux condenser for 4 h. Cool and add 25 ml of 0.5 M *hydrochloric acid*. Shake with 100 ml of *methylene chloride R*. Evaporate the lower layer to dryness on a water-bath. Dissolve the residue in 10 ml of a mixture of 1 volume of *methanol R* and 2 volumes of *methylene chloride R*, add 10 ml of the test solution and dilute to 25 ml with a mixture of 1 volume of *methanol R* and 2 volumes of *methylene chloride R*.

Apply separately to a plate (100 mm square) 1 µl of each solution. Develop in an unsaturated tank over a path of 7 cm using a mixture of 10 volumes of *methanol R*, 30 volumes of a 59 g/l solution of *sodium chloride R* and 60 volumes of *dioxan R*. Allow the plate to dry in an oven at 160 °C for 15 min and place the hot plate in a closed tank containing about 20 ml of *fuming nitric acid R* for 30 min. Remove the plate and heat it again at 160 °C for 15 min. Allow to cool and examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 40 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *ethanolic sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 48.91 mg of $C_{30}H_{33}ClN_2O_2$.

STORAGE

Store protected from light.

01/2005:1719 Injection: 10 µl.

DIPIVEFRINE HYDROCHLORIDE**Dipivefrini hydrochloridum** $C_{19}H_{30}ClNO_5$ M_r 387.9**DEFINITION**

Hydrochloride of 4-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]-1,2-phenylene bis(2,2-dimethylpropanoate).

Content: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very soluble in methanol, freely soluble in ethanol (96 per cent) and in methylene chloride.

mp: about 160 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: dipivefrine hydrochloride CRS.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Impurities A and B. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in 0.01 M hydrochloric acid and dilute to 10.0 ml with the same acid.

Reference solution. Dissolve 10.0 mg of adrenaline R and 10.0 mg of adrenalone hydrochloride R in 0.01 M hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 1.0 ml of this solution to 10.0 ml with 0.01 M hydrochloric acid. Protect this solution from light.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5 µm).

Mobile phase:

- *mobile phase A*: 0.1 per cent V/V solution of anhydrous formic acid R,
- *mobile phase B*: methanol R2, acetonitrile R (40:60 V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	100	0
3 - 5	100 → 40	0 → 60
5 - 10	40	60
10 - 11	40 → 100	60 → 0
11 - 25	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 260 nm.

Retention times: impurity A = about 2.2 min; impurity B = about 3.2 min.

System suitability: reference solution:

- *resolution*: minimum 2.0 between the peaks due to impurity A and impurity B.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Liquid chromatography (2.2.29).

Solvent mixture. Mix 40 volumes of methanol R2 and 60 volumes of acetonitrile R. Mix 55 volumes of this mixture and 45 volumes of 0.01 M hydrochloric acid.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of dipivefrine for system suitability CRS (containing impurities C, D and E) in the solvent mixture and dilute to 2.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5.0 mg of dipivefrine hydrochloride CRS in the solvent mixture and dilute to 2.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 25.0 ml with the solvent mixture.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5 µm).

Mobile phase: mix 45 volumes of a 0.7 g/l solution of concentrated ammonia R adjusted to pH 10.0 with dilute acetic acid R and 55 volumes of a mixture of 40 volumes of methanol R2 and 60 volumes of acetonitrile R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 10 µl.

Run time: 2.5 times the retention time of dipivefrine.

Relative retention with reference to dipivefrine (retention time = about 7 min): impurities C and D = about 0.4; impurity E = about 1.3; impurity F = about 2.0.

System suitability: reference solution (b):

- *resolution*: minimum 3.0 between the peaks due to dipivefrine and impurity E.

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurities C and D = 0.5; impurity E = 0.06;
- *sum of impurities C and D*: not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurities E, F*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *any other impurity*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

- *total*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent), disregard any peak with a mass distribution ratio of less than 0.5.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 6 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: 20 µl of reference solutions (a) and (c).

Calculate the percentage content of $C_{19}H_{30}ClNO_5$ using the chromatograms obtained with reference solutions (a) and (c) and the declared content of *dipivefrine hydrochloride CRS*.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

- A. R1 = R2 = R3 = H: 4-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]benzene-1,2-diol ((±)-adrenaline),
- C. R1 = R3 = H, R2 = CO-C(CH₃)₃: 2-hydroxy-5-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]phenyl 2,2-dimethylpropanoate,
- D. R1 = CO-C(CH₃)₃, R2 = R3 = H: 2-hydroxy-4-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]phenyl 2,2-dimethylpropanoate,
- F. R1 = R2 = CO-C(CH₃)₃, R3 = C₂H₅: 4-[(1*RS*)-2-(ethylmethylamino)-1-hydroxyethyl]-1,2-phenylene bis(2,2-dimethylpropanoate),

- B. R = H: 1-(3,4-dihydroxyphenyl)-2-(methylamino)ethanone (adrenalone),
- E. R = CO-C(CH₃)₃: 4-[(methylamino)acetyl]-1,2-phenylene bis(2,2-dimethylpropanoate) (adrenalone dipivalate ester).

01/2005:0898

DIPOTASSIUM CLORAZEPATE

Dikalii clorazepas

$C_{16}H_{11}ClK_2N_2O_4$

M_r 408.9

DEFINITION

Potassium (3*RS*)-7-chloro-2-oxo-5-phenyl-2,3-dihydro-1*H*-1,4-benzodiazepine-3-carboxylate compound with potassium hydroxide (1:1).

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or light yellow, crystalline powder.

Solubility: freely soluble to very soluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride.

Solutions in water and in alcohol are unstable and are to be used immediately.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 10.0 mg in a 0.3 g/l solution of *potassium carbonate R* and dilute to 100.0 ml with the same solution (solution A). Dilute 10.0 ml of solution A to 100.0 ml with a 0.3 g/l solution of *potassium carbonate R* (solution B). Examined between 280 nm and 350 nm (2.2.25), solution A shows a broad absorption maximum at about 315 nm. The specific absorbance at the absorption maximum at 315 nm is 49 to 56. Examined between 220 nm and 280 nm (2.2.25), solution B shows an absorption maximum at 230 nm. The specific absorbance at the absorption maximum at 230 nm is 800 to 870.
- B. Infrared absorption spectrophotometry (2.2.24).
Preparation: discs.
Comparison: *Ph. Eur. reference spectrum of dipotassium clorazepate*.
- C. Dissolve about 20 mg in 2 ml of *sulphuric acid R*. Observed in ultraviolet light at 365 nm, the solution shows yellow fluorescence.
- D. Dissolve 0.5 g in 5 ml of *water R*. Add 0.1 ml of *thymol blue solution R*. The solution is violet-blue.
- E. Place 1.0 g in a crucible and add 2 ml of *dilute sulphuric acid R*. Heat at first on a water-bath, then ignite until all black particles have disappeared. Allow to cool. Take up the residue with *water R* and dilute to 20 ml with the same solvent. The solution gives reaction (b) of potassium (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₅ (2.2.2, *Method II*).

Rapidly dissolve 2.0 g with shaking in *water R* and dilute to 20.0 ml with the same solvent. Observe immediately.

Related substances. Thin-layer chromatography (2.2.27). *Prepare the solutions immediately before use and carry out the test protected from light.*

Test solution. Dissolve 0.20 g of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent. Shake immediately with 2 quantities, each of 5.0 ml, of *methylene chloride R*. Combine the organic layers and dilute to 10.0 ml with *methylene chloride R*.

Reference solution (a). Dissolve 10 mg of *aminochlorobenzophenone R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with *methylene chloride R*.

Reference solution (b). Dissolve 5 mg of *nordazepam CRS* in *methylene chloride R* and dilute to 25.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with *methylene chloride R*.

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 20.0 ml with *methylene chloride R*.

Reference solution (d). Dissolve 5 mg of *nordazepam CRS* and 5 mg of *nitrazepam CRS* in *methylene chloride R* and dilute to 25 ml with the same solvent.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: acetone *R*, *methylene chloride R* (15:85 V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (d) shows 2 clearly separated spots.

Limits A:

- **impurity B:** any spot due to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **any other impurity:** any spot, apart from any spot due to impurity B, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

Detection B: spray with a freshly prepared 10 g/l solution of *sodium nitrite R* in *dilute hydrochloric acid R*. Dry in a current of warm air and spray with a 4 g/l solution of *naphthylethylenediamine dihydrochloride R* in *alcohol R*.

Limits B:

- **impurity A:** any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

ASSAY

Dissolve 0.130 g in 10 ml of *anhydrous acetic acid R*. Add 30 ml of *methylene chloride R*. Titrate with 0.1 M *perchloric acid*, determining the 2 points of inflexion by potentiometry (2.2.20).

At the 2nd point of inflexion, 1 ml of 0.1 M *perchloric acid* is equivalent to 13.63 mg of $C_{16}H_{11}ClK_2N_2O_4$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B.

- A. (2-amino-5-chlorophenyl)phenylmethanone (aminochlorobenzophenone),

- B. 7-chloro-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one (nordazepam).

01/2005:1003

DIPOTASSIUM PHOSPHATE

Dikalii fosphas

M_r 174.2

DEFINITION

Dipotassium phosphate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of K_2HPO_4 , calculated with reference to the dried substance.

CHARACTERS

A white powder or colourless crystals, very hygroscopic, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) is slightly alkaline (2.2.4).
B. Solution S gives reaction (b) of phosphates (2.3.1).
C. Solution S gives reaction (a) of potassium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Reducing substances. Heat on a water-bath for 5 min a mixture of 5 ml of solution S, 5 ml of *dilute sulphuric acid R* and 0.25 ml of 0.02 M *potassium permanganate*. The solution remains faintly pink.

Monopotassium phosphate. Calculated from the number of millilitres of 1 M *hydrochloric acid* (10.0 ml) and of 1 M *sodium hydroxide* (n_1 ml and n_2 ml) used in the assay, the ratio:

$$\frac{n_2 - 10}{10 - n_1}$$

does not exceed 0.025 (2.5 per cent).

Chlorides (2.4.4). To 2.5 ml of solution S add 10 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 1.5 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (0.1 per cent).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (2 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in 8 ml of *water R*. Acidify with about 6 ml of *dilute hydrochloric acid R* (pH 3 to 4) and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Sodium. If intended for use in the manufacture of parenteral dosage forms, it contains not more than 0.1 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Measure the emission intensity at 589 nm.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 125 °C to 130 °C.

Bacterial endotoxins (2.6.14): less than 1.1 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.800 g (*m*) in 40 ml of *carbon dioxide-free water R* and add 10.0 ml of *1 M hydrochloric acid*. Using *1 M sodium hydroxide*, titrate potentiometrically (2.2.20) to the first inflexion point of the pH curve (n_1 ml). Continue the titration to the second inflexion point of the curve (total volume of *1 M sodium hydroxide* required, n_2 ml).

Calculate the percentage content of K_2HPO_4 from the expression:

$$\frac{1742(10 - n_1)}{m(100 - d)}$$

d = percentage loss on drying.

STORAGE

Store in an airtight container.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0486

DIPROPHYLLINE

Diprophyllinum

$C_{10}H_{14}N_4O_4$

M_r 254.2

DEFINITION

Diprophylline contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7-[(2*RS*)-2,3-dihydroxypropyl]-1,3-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

A. Melting point (2.2.14): 160 °C to 165 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *diprophylline CRS*. Examine the substances as discs prepared using 0.5 mg to 1 mg of the substance to be examined in 0.3 g of *potassium bromide R*.

C. Dissolve 1 g in 5 ml of *acetic anhydride R* and boil under a reflux condenser for 15 min. Allow to cool and add 100 ml of a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*. Cool in iced water for at least 20 min, shaking from time to time. Filter, wash the precipitate with a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*, recrystallise from *alcohol R* and dry *in vacuo*. The crystals melt (2.2.14) at 142 °C to 148 °C.

D. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.25 ml of *bromothymol blue solution R1*. The solution is yellow or green. Not more than 0.4 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.3 g of the substance to be examined in a mixture of 20 volumes of *water R* and 30 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. *Prepare immediately before use.*

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol R*.

Reference solution (b). Dilute 0.2 ml of the test solution to 100 ml with *methanol R*.

Reference solution (c). Dissolve 10 mg of *theophylline R* in *methanol R*, add 0.3 ml of the test solution and dilute to 10 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 10 volumes of *ethanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (400 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in 3.0 ml of *anhydrous formic acid R* and add 50.0 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.42 mg of $C_{24}H_{40}N_8O_4$.

STORAGE

Store protected from light.

01/2005:1199

DIPYRIDAMOLE

Dipyridamolum

$C_{24}H_{40}N_8O_4$

M_r 504.6

DEFINITION

Dipyridamole contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2,2',2'',2'''-[4,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,6-diyl]dinitrilo]tetraethanol, calculated with reference to the dried substance.

CHARACTERS

A bright yellow, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in ethanol. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 162 °C to 168 °C.

B. Dissolve 10 mg in a mixture of 1 volume of 0.1 M *hydrochloric acid* and 9 volumes of *methanol R* and dilute to 50.0 ml with the same mixture of solvents. Dilute 5.0 ml of this solution to 100.0 ml with a mixture of 1 volume of 0.1 M *hydrochloric acid* and 9 volumes of *methanol R*. Examined between 220 nm and 350 nm

(2.2.25), the solution shows two absorption maxima at 232 nm and 284 nm. The ratio of the absorbance measured at the maximum at 284 nm to that measured at the maximum at 232 nm is 1.25 to 1.45.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dipyridamole CRS*. Examine the substances as discs prepared using *potassium bromide R*.

D. Dissolve about 5 mg in a mixture of 0.1 ml of *nitric acid R* and 2 ml of *sulphuric acid R*. An intense violet colour is produced.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *diltiazem hydrochloride CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.3 ml/min a mixture prepared as follows: dissolve 0.504 g of *potassium dihydrogen phosphate R* in 370 ml of *water R* and adjust to pH 3.0 with *phosphoric acid R*; add 80 ml of *acetonitrile R* and 550 ml of *methanol R*,
- as detector a spectrophotometer set at 290 nm, maintaining the temperature of the column at 30 °C.

Inject 20 µl of each solution and continue the chromatography of the test solution for nine times the retention time of dipyridamole. The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding respectively to diltiazem and dipyridamole is at least 2.0. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent); and the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.1 times that of the peak in the chromatogram obtained with reference solution (a).

Chlorides (2.4.4). To 0.250 g add 10 ml of *water R* and strongly shake. Filter, rinse the filter with 5 ml of *water R* and dilute to 15 ml with *water R*. The combined filtrates comply with the limit test for chlorides (200 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 70 ml of *methanol R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 50.46 mg of $C_{24}H_{40}N_8O_4$.

STORAGE

Store protected from light.

IMPURITIES

- A. $R = R' = \text{NC}_5\text{H}_{10}$: 2,2'-[[4,6,8-tri(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-2-yl]nitrilo]diethanol,
- B. $R = R' = \text{N}(\text{CH}_2\text{-CH}_2\text{OH})_2$: 2,2',2'',2''',2''''',2'''''-[[8-(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,4,6-triyl]trinitrilo]hexaethanol,
- C. $R = \text{NC}_5\text{H}_{10}$, $R' = \text{Cl}$: 2,2'-[[2-chloro-4,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-6-yl]nitrilo]diethanol.

01/2005:1313

DIRITHROMYCIN

Dirithromycinum

 $\text{C}_{42}\text{H}_{78}\text{N}_2\text{O}_{14}$ M_r 835

DEFINITION

Dirithromycin is (1*R*,2*S*,3*R*,6*R*,7*S*,8*S*,9*R*,10*R*,12*R*,13*S*,15*R*,17*S*)-9-[[3-(dimethylamino)-3,4,6-trideoxy-β-*D*-xylo-hexopyranosyl]oxy]-3-ethyl-2,10-dihydroxy-15-[(2-methoxyethoxy)methyl]-2,6,8,10,12,17-hexamethyl-7-[(3-*C*-methyl-3-*O*-methyl-2,6-dideoxy-α-*L*-ribo-hexopyranosyl)oxy]-4,16-dioxo-14-azabicyclo[11.3.1]heptadecan-5-one (or (9*S*)-9,11-[iminol[(1*R*)-2-(2-methoxyethoxy)ethylidene]oxy]-9-deoxo-11-deoxyerythromycin). The sum of the percentage contents of $\text{C}_{42}\text{H}_{78}\text{N}_2\text{O}_{14}$ and dirithromycin 15*S*-epimer is not less than 96.0 per cent and not more than the equivalent of 102.0 per cent, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, very soluble in methanol and in methylene chloride. It shows polymorphism.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dirithromycin CRS*. Examine the substance prepared as discs.

- B. Examine the chromatograms obtained in the assay.

The retention time and size of the principal peak in the chromatogram obtained with test solution (a) are similar to those of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by liquid chromatography (2.2.29), as described under Assay. Inject 10 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject 10 µl of test solution (b) and continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with test solution (b): the area of any peak corresponding to impurity A is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity A and any peak corresponding to 15*S*-epimer, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent).

Dirithromycin 15*S*-epimer. Not more than 1.5 per cent, determined by liquid chromatography (2.2.29), as described under Assay. Inject 10 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) six times. The test is not valid unless the relative standard deviation of the peak area for dirithromycin is at most 5.0 per cent. Inject alternately test solution (b) and reference solution (b). Calculate the percentage content of dirithromycin 15*S*-epimer using the chromatogram obtained with reference solution (b).

Acetonitrile (2.4.24, *System A*). Not more than 0.1 per cent. Prepare the solutions using *dimethylformamide R* instead of *water R*.

Sample solution. Dissolve 0.200 g of the substance to be examined in *dimethylformamide R* and dilute to 20.0 ml with the same solvent.

The following static head-space injection conditions may be used:

- equilibration temperature: 120 °C,
- equilibration time: 60 min,
- transfer-line temperature: 125 °C.

Heavy metals (2.4.8). Dissolve 1.0 g in 20 ml of a mixture of equal volumes of *methanol R* and *water R*. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of equal volumes of *methanol R* and *water R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Solvent mixture. Mix 30 volumes of *methanol R* and 70 volumes of *acetonitrile R*.

Test solution (a). Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dissolve 0.10 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 20.0 mg of *dirithromycin CRS* in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (c). Dissolve 20 mg of *dirithromycin CRS* in the mobile phase and dilute to 10 ml with the mobile phase. Allow to stand for 24 h before use.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.0 ml/min a mixture of: 9 volumes of *water R*; 19 volumes of *methanol R*; 28 volumes of a solution containing 1.9 g/l of *potassium dihydrogen phosphate R* and 9.1 g/l of *dipotassium hydrogen phosphate R* adjusted to pH 7.5 if necessary with a 100 g/l solution of *potassium hydroxide R*; 44 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 205 nm,

maintaining the temperature of the column at 40 °C. Inject 10 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 10 µl of reference solution (c). When the chromatogram is recorded in the prescribed conditions, the retention times relative to dirithromycin are: impurity A about 0.7 and 15*S*-epimer about 1.1. The test is not valid unless, in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to dirithromycin and its 15*S*-epimer is at least 2.0 (if necessary adjust the concentration of the organic modifiers in the mobile phase). Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for dirithromycin is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

IMPURITIES

- A. (9*S*)-9-amino-9-deoxyerythromycin,
- B. R = H: (9*S*)-9-amino-3-de(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -*L*-ribo-hexopyranosyl)-9-deoxyerythromycin,

- C. R = CH₂-O-CH₂-CH₂-O-CH₃, R' = H, R₂ = H, R₃ = CH₃: (9*S*)-9,11-[imino[(1*RS*)-2-(2-methoxyethoxy)ethylidene]oxy]-9-deoxy-11,12-dideoxyerythromycin (dirithromycin B),
- D. R = CH₂-O-CH₂-CH₂-O-CH₃, R' = H, R₂ = OH, R₃ = H: (9*S*)-9,11-[imino[(1*RS*)-2-(2-methoxyethoxy)ethylidene]oxy]-3'-*O*-demethyl-9-deoxy-11-deoxyerythromycin (dirithromycin C),
- E. R = CH₃, R' = CH₃, R₂ = OH, R₃ = CH₃: 9,11-[imino(1-methylethylidene)oxy]-9-deoxy-11-deoxyerythromycin.

01/2005:0232

DISODIUM EDETATE

Dinatrii edetas

C₁₀H₁₄N₂Na₂O₈·2H₂O

M_r 372.2

DEFINITION

Disodium dihydrogen (ethylenedinitrilo)tetraacetate dihydrate.

Content: 98.5 per cent to 101.0 per cent.

CHARACTERS

Appearance: white, crystalline powder.

Solubility: soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *disodium edetate CRS*.

B. Dissolve 2 g in 25 ml of *water R*, add 6 ml of *lead nitrate solution R*, shake and add 3 ml of *potassium iodide solution R*. No yellow precipitate is formed. Make alkaline to *red litmus paper R* by the addition of *dilute ammonia R2*. Add 3 ml of *ammonium oxalate solution R*. No precipitate is formed.

C. Dissolve 0.5 g in 10 ml of *water R* and add 0.5 ml of *calcium chloride solution R*. Make alkaline to *red litmus paper R* by the addition of *dilute ammonia R2* and add 3 ml of *ammonium oxalate solution R*. No precipitate is formed.

D. It gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 4.0 to 5.5 for solution S.

Impurity A. Liquid chromatography (2.2.29). Carry out the test protected from light.

Solvent mixture. Dissolve 10.0 g of *ferric sulphate pentahydrate R* in 20 ml of 0.5 M sulphuric acid and add 780 ml of *water R*. Adjust to pH 2.0 with 1 M sodium hydroxide and dilute to 1000 ml with *water R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dissolve 40.0 mg of *nitrilotriacetic acid R* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. To 1.0 ml of the solution add 0.1 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: spherical graphitised carbon for chromatography R1 (5 μ m) with a specific surface area of 120 m²/g and a pore size of 25 nm.

Mobile phase: dissolve 50.0 mg of *ferric sulphate pentahydrate R* in 50 ml of 0.5 M sulphuric acid and add 750 ml of *water R*. Adjust to pH 1.5 with 0.5 M sulphuric acid or 1 M sodium hydroxide, add 20 ml of *ethylene glycol R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 273 nm.

Injection: 20 μ l; filter the solutions and inject immediately.

Run time: 4 times the retention time of the iron complex of impurity A.

Retention times: iron complex of impurity A = about 5 min; iron complex of edetic acid = about 10 min.

System suitability: reference solution:

- resolution: minimum 7 between the peaks due to the iron complex of impurity A and the iron complex of edetic acid,
- signal-to-noise ratio: minimum 50 for the peak due to impurity A.

Limit:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Iron (2.4.9): maximum 80 ppm.

Dilute 2.5 ml of solution S to 10 ml with *water R*. Add 0.25 g of *calcium chloride R* to the test solution and the standard before the addition of the *thioglycollic acid R*.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

ASSAY

Dissolve 0.300 g in *water R* and dilute to 300 ml with the same solvent. Add 2 g of *hexamethylenetetramine R* and 2 ml of *dilute hydrochloric acid R*. Titrate with 0.1 M *lead nitrate*, using about 50 mg of *xenol orange triturate R* as indicator.

1 ml of 0.1 M *lead nitrate* is equivalent to 37.22 mg of $C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

A. nitrilotriacetic acid.

01/2005:1509
corrected

DISODIUM PHOSPHATE, ANHYDROUS

Dinatrii phosphas anhydricus

Na_2HPO_4

M_r 142.0

DEFINITION

Anhydrous disodium phosphate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of Na_2HPO_4 , calculated with reference to the dried substance.

CHARACTERS

A white powder, hygroscopic, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) is slightly alkaline (2.2.4).
- It complies with the test for loss on drying (see Tests).
- Solution S (see Tests) gives reaction (b) of phosphates (2.3.1).
- Solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Reducing substances. To 10 ml of solution S add 5 ml of *dilute sulphuric acid R* and 0.25 ml of 0.02 M *potassium permanganate* and heat on a water-bath for 5 min. The solution retains a slight red colour.

Monosodium phosphate. Calculated from the number of millilitres of 1 M *hydrochloric acid* (25 ml) and of 1 M *sodium hydroxide* (n_1 ml and n_2 ml) used in the assay, the ratio:

$$\frac{n_2 - 25}{25 - n_1}$$

does not exceed 0.025.

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *dilute nitric acid R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 6 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (500 ppm).

Arsenic (2.4.2). 10 ml of solution S complies with limit test A for arsenic (2 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using 5 ml of *lead standard solution (1 ppm Pb) R* and 5 ml of *water R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

ASSAY

Dissolve 1.600 g (*m*) in 25.0 ml of *carbon dioxide-free water R* and add 25.0 ml of *1 M hydrochloric acid*. Using *1 M sodium hydroxide*, titrate potentiometrically (2.2.20) to the first inflexion point (n_1 ml). Continue the titration to the second inflexion point (total volume of *1 M sodium hydroxide* required, n_2 ml).

Calculate the percentage content of Na_2HPO_4 from the expression:

$$\frac{1420 (25 - n_1)}{m (100 - d)}$$

d = percentage loss on drying.

STORAGE

Store in an airtight container.

01/2005:0602

DISODIUM PHOSPHATE DIHYDRATE

Dinatrii phosphas dihydricus

$\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$

M_r 178.0

DEFINITION

Disodium phosphate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of Na_2HPO_4 , calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder or colourless crystals, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) is slightly alkaline (2.2.4).
- It complies with the test for loss on drying (see Tests).
- Solution S gives reaction (b) of phosphates (2.3.1).
- Solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Reducing substances. To 5 ml of solution S add 5 ml of *dilute sulphuric acid R* and 0.25 ml of *0.02 M potassium permanganate* and heat on a water-bath for 5 min. The solution retains a slight red colour.

Monosodium phosphate. Calculated from the number of millilitres of *1 M hydrochloric acid* (25 ml) and of *1 M sodium hydroxide* (n_1 ml and n_2 ml) used in the assay, the ratio:

$$\frac{n_2 - 25}{25 - n_1}$$

does not exceed 0.025.

Chlorides (2.4.4). To 2.5 ml of solution S add 10 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (400 ppm).

Sulphates (2.4.13). To 3 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (0.1 per cent).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (4 ppm).

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (40 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 19.5 per cent to 21.0 per cent, determined on 1.000 g by drying in an oven at 130 °C.

ASSAY

Dissolve 2.000 g (*m* g) in 50 ml of *water R* and add 25.0 ml of *1 M hydrochloric acid*. Using *1 M sodium hydroxide*, titrate potentiometrically (2.2.20) to the first inflexion point of the pH curve (n_1 ml). Continue the titration to the second inflexion point of the curve (total volume of *1 M sodium hydroxide* required, n_2 ml).

Calculate the percentage content of Na_2HPO_4 from the expression:

$$\frac{1420 (25 - n_1)}{m (100 - d)}$$

d = percentage loss on drying.

01/2005:0118

DISODIUM PHOSPHATE DODECAHYDRATE

Dinatrii phosphas dodecahydricus

$\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$

M_r 358.1

DEFINITION

Disodium phosphate dodecahydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of Na_2HPO_4 , calculated with reference to the anhydrous substance.

CHARACTERS

Colourless, transparent crystals, very efflorescent, very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) gives the reactions of phosphates (2.3.1).
- Solution S gives the reactions of sodium (2.3.1).

TESTS

01/2005:1006

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Reducing substances. To 5 ml of solution S add 5 ml of *dilute sulphuric acid R* and 0.25 ml of 0.02 M *potassium permanganate* and heat on a water-bath for 5 min. The solution retains a slight red colour.

Monosodium phosphate. Calculated from the number of millilitres of 1 M *hydrochloric acid* (25 ml) and of 1 M *sodium hydroxide* (n_1 ml and n_2 ml) used in the assay, the ratio:

$$\frac{n_2 - 25}{25 - n_1}$$

does not exceed 0.025.

Chlorides (2.4.4). To 2.5 ml of solution S add 10 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 3 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (500 ppm).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (2 ppm).

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Water (2.5.12). 57.0 per cent to 61.0 per cent, determined on 50.0 mg by the semi-micro determination of water. Use a mixture of 10 volumes of *anhydrous methanol R* and 40 volumes of *formamide R* as solvent.

ASSAY

Dissolve 4.00 g (m g) in 25 ml of *water R* and add 25.0 ml of 1 M *hydrochloric acid*. Using 1 M *sodium hydroxide*, titrate potentiometrically (2.2.20) to the first inflexion point of the pH curve (n_1 ml). Continue the titration to the second inflexion point of the curve (total volume of 1 M *sodium hydroxide* required, n_2 ml).

Calculate the percentage content of Na_2HPO_4 from the expression:

$$\frac{1420 (25 - n_1)}{m (100 - d)}$$

d = percentage water content.

DISOPYRAMIDE

Disopyramidum

and enantiomer

$\text{C}_{21}\text{H}_{29}\text{N}_3\text{O}$

M_r 339.5

DEFINITION

Disopyramide contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (2*RS*)-4-[bis(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, freely soluble in methylene chloride, soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- Dissolve 40.0 mg in a 5 g/l solution of *sulphuric acid R* in *methanol R* and dilute to 100.0 ml with the same solution. Dilute 5.0 ml of this solution to 50.0 ml with a 5 g/l solution of *sulphuric acid R* in *methanol R*. Examined between 240 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 269 nm and a shoulder at 263 nm. The specific absorbance at the maximum is 190 to 210.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *disopyramide CRS*. Examine the substances as discs prepared by placing 50 μl of a 50 g/l solution in *methylene chloride R* on a disc of *potassium bromide R*. Dry the discs at 60 °C for 1 h before use.
- Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *dilute potassium iodobismuthate solution R*. Examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *disopyramide CRS* in *methanol R* and dilute to 10 ml with the same solvent.

01/2005:1005

Reference solution (b). Dilute 0.5 ml of test solution (b) to 20 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 30 volumes of *acetone R* and 30 volumes of *cyclohexane R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 80 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 2 h.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 30 ml of *anhydrous acetic acid R*. Add 0.2 ml of *naphtholbenzein solution R*. Titrate with 0.1 M *perchloric acid* until the colour changes from yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 16.97 mg of $C_{21}H_{29}N_3O_5$.

STORAGE

Store protected from light.

IMPURITIES

- A. $R = CN$, $R' = CH(CH_3)_2$: (2RS)-4-[bis(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanenitrile (di-isopyronitrile),
- B. $R = H$, $R' = CH(CH_3)_2$: (3RS)-N,N-bis(1-methylethyl)-3-phenyl-3-(pyridin-2-yl)propan-1-amine,
- C. $R = CO-NH_2$, $R' = H$: (2RS)-4-[(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanamide,

- D. (RS)-phenyl(pyridin-2-yl)acetonitrile (pyronitrile).

DISOPYRAMIDE PHOSPHATE

Disopyramidi phosphas

 $C_{21}H_{32}N_3O_5P$
 M_r 437.5

DEFINITION

Disopyramide phosphate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2RS)-4-[bis(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanamide dihydrogen phosphate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Dissolve 50.0 mg in a 5 g/l solution of *sulphuric acid R* in *methanol R* and dilute to 100.0 ml with the same solution. Dilute 5.0 ml of this solution to 50.0 ml with a 5 g/l solution of *sulphuric acid R* in *methanol R*. Examined between 240 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 269 nm and a shoulder at 263 nm. The specific absorbance at the maximum is 147 to 163.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *disopyramide phosphate CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *dilute potassium iodobismuthate solution R*. Examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Solution S (see Tests) gives reaction (a) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 5.0.

01/2005:0603

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel GF_{254} R as the coating substance.

Test solution (a). Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 25 mg of *disopyramide phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 30 volumes of *acetone R* and 30 volumes of *cyclohexane R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.180 g in 30 ml of *anhydrous acetic acid R*. Add 0.2 ml of *naphtholbenzein solution R*. Titrate with 0.1 M *perchloric acid* until the colour changes from yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 21.88 mg of $C_{10}H_{20}N_2S_4$.

STORAGE

Store protected from light.

IMPURITIES

- A. $R = CN$, $R' = CH(CH_3)_2$: (2*RS*)-4-[bis(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanenitrile (di-isopyronitrile),
- B. $R = H$, $R' = CH(CH_3)_2$: (3*RS*)-*N,N*-bis(1-methylethyl)-3-phenyl-3-(pyridin-2-yl)propan-1-amine,
- C. $R = CO-NH_2$, $R' = H$: (2*RS*)-4-[(1-methylethyl)amino]-2-phenyl-2-(pyridin-2-yl)butanamide,

- D. (*RS*)-phenyl(pyridin-2-yl)acetonitrile (pyronitrile).

DISULFIRAM

Disulfiramum

 $C_{10}H_{20}N_2S_4$
 M_r 296.5

DEFINITION

Disulfiram contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of tetraethyldisulfanedicarbothioamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 70 °C to 73 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *disulfiram CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 10 mg in 10 ml of *methanol R*. Add 2 ml of a 0.5 g/l solution of *cupric chloride R* in *methanol R*. A yellow colour develops which becomes greenish-yellow.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *ethyl acetate R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *ethyl acetate R*.

Reference solution (a). Dissolve 10 mg of *disulfiram CRS* in *ethyl acetate R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *ethyl acetate R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *butyl acetate R* and 70 volumes of *hexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Diethyldithiocarbamate. Dissolve 0.20 g in 10 ml of *peroxide-free ether R*, add 5 ml of *buffer solution pH 8.0 R* and shake vigorously. Discard the upper layer and wash the

lower layer with 10 ml of *peroxide-free ether R*. Add to the lower layer 0.2 ml of a 4 g/l solution of *copper sulphate R* and 5 ml of *cyclohexane R*. Shake. Any yellow colour in the upper layer is not more intense than that of a standard prepared at the same time using 0.2 ml of a freshly prepared 0.15 g/l solution of *sodium diethyldithiocarbamate R* (150 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 50 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.450 g in 80 ml of *acetone R* and add 20 ml of a 20 g/l solution of *potassium nitrate R*. Titrate with 0.1 M *silver nitrate*. Determine the end-point potentiometrically (2.2.20), using a silver electrode and a silver-silver chloride double-junction electrode saturated with potassium nitrate. 1 ml of 0.1 M *silver nitrate* is equivalent to 59.30 mg of $C_{10}H_{20}N_2S_4$.

STORAGE

Store protected from light.

IMPURITIES

A. diethylthiocarbamic thioanhydride (sulfiram),

B. diethyldithiocarbamate.

01/2005:1007

DITHRANOL

Dithranolum

$C_{14}H_{10}O_3$

M_r 226.2

DEFINITION

Dithranol contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 1,8-dihydroxyanthracen-9(10H)-one, calculated with reference to the dried substance.

CHARACTERS

A yellow or brownish-yellow, crystalline powder, practically insoluble in water, soluble in methylene chloride, sparingly soluble in acetone, slightly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

Carry out all tests protected from bright light and use freshly prepared solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It melts (2.2.14) at 178 °C to 182 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dithranol CRS*.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *dithranol CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve about 5 mg of *dantron R* in 5 ml of reference solution (a).

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of equal volumes of *hexane R* and *methylene chloride R*. Allow the plate to dry in air. Place the plate in a tank saturated with ammonia vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. To 5 mg add 0.1 g of *anhydrous sodium acetate R* and 1 ml of *acetic anhydride R*. Boil for 30 s. Add 20 ml of *alcohol R*. Examined in ultraviolet light at 365 nm, the solution shows a blue fluorescence.

TESTS

Related substances

A. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.200 g of the substance to be examined in 20 ml of *methylene chloride R*, add 1.0 ml of *glacial acetic acid R* and dilute to 100.0 ml with *hexane R*.

Reference solution. Dissolve 5.0 mg each of *anthrone R*, *dantron R*, *dithranol impurity C CRS* and *dithranol CRS* in *methylene chloride R* and dilute to 5.0 ml with the same solvent. To 1.0 ml of the solution, add 19.0 ml of *methylene chloride R* and 1.0 ml of *glacial acetic acid R*, and dilute to 50.0 ml with *hexane R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 1 volume of *glacial acetic acid R*, 5 volumes of *methylene chloride R* and 82 volumes of *hexane R*,
- as detector a spectrophotometer set at 260 nm.

Inject 20 µl of each solution. Continue the chromatography for 1.5 times the retention time of dithranol impurity C. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is about 70 per cent of the full scale of the recorder. When the chromatograms are recorded in the prescribed conditions, the substances are eluted in

the following sequence: dithranol, dantron, anthrone, dithranol impurity C. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks due to dithranol and dantron is greater than 2.0. In the chromatogram obtained with the test solution: the area of any peak corresponding to anthrone, dantron or dithranol impurity C is not greater than that of the corresponding peak in the chromatogram obtained with the reference solution (1 per cent); the area of any peak apart from the principal peak and any peaks due to anthrone, dantron and dithranol impurity C is not greater than that of the peak due to dithranol in the chromatogram obtained with the reference solution (1 per cent).

B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

Reference solution. Dissolve 5.0 mg of *dithranol impurity D CRS* and 5.0 mg of *dithranol CRS* in 5 ml of *tetrahydrofuran R* and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.20 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.9 ml/min a mixture of 2.5 volumes of *glacial acetic acid R*, 40 volumes of *tetrahydrofuran R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of each solution. Continue the chromatography for 3 times the retention time of the peak due to dithranol. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is about 50 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks due to dithranol impurity D and dithranol is greater than 2.5. In the chromatogram obtained with the test solution, the area of any peak corresponding to dithranol impurity Dis not greater than that of the corresponding peak in the chromatogram obtained with the reference solution (2.5 per cent).

The total content of related substances as determined in tests A and B is not more than 3.0 per cent.

Chlorides (2.4.4). Shake 1.0 g with 20 ml of *water R* for 1 min and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous pyridine R*. Titrate with 0.1 M *tetrabutylammonium hydroxide* under *nitrogen R*. Determine the end-point potentiometrically (2.2.20), using a glass indicator electrode and a calomel reference electrode containing, as the electrolyte, a saturated solution of *potassium chloride R* in *methanol R*.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 22.62 mg of C₁₄H₁₀O₃.

STORAGE

Store protected from light.

IMPURITIES

- A. R1 = R2 = H, X = H₂: anthracen-9(10*H*)-one (anthrone),
 B. R1 = R2 = OH, X = O: 1,8-dihydroxyanthracene-9,10-dione (dantron),
 D. R1 = OH, R2 = H, X = H₂: 1-hydroxyanthracen-9(10*H*)-one,

- C. C. 4,4',5,5'-tetrahydroxy-9,9'-bianthracenyl-10,10'(9*H*, 9'*H*)-dione.

01/2005:1200

DOBUTAMINE HYDROCHLORIDE

Dobutamini hydrochloridum

C₁₈H₂₄ClNO₃

M_r 337.9

DEFINITION

Dobutamine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-4-[2-[[3-(4-hydroxyphenyl)-1-methylpropyl]amino]ethyl]benzene-1,2-diol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, soluble in methanol, sparingly soluble in alcohol.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 189 °C to 192 °C.
 B. Dissolve 20.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 300 nm (2.2.25), the solution shows two absorption maxima, at 223 nm and 281 nm. The ratio of the absorbance measured at the maximum at 281 nm to that measured at the maximum at 223 nm is 0.34 to 0.36.

- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *dobutamine hydrochloride CRS*. Examine the substances prepared as discs.
- D. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg in a mixture of equal volumes of *glacial acetic acid R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10.0 mg of *dobutamine hydrochloride CRS* in a mixture of equal volumes of *glacial acetic acid R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5.0 mg of *dopamine hydrochloride CRS* in 5 ml of the test solution.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *water R*, 15 volumes of *glacial acetic acid R*, 30 volumes of *ether R* and 45 volumes of *butanol R*. Dry the plate and spray with a 1 g/l solution of *potassium permanganate R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- E. It gives reaction (a) of chlorides (2.3.1) using a mixture of equal volumes of *methanol R* and *water R*.

TESTS

Acidity or alkalinity. Dissolve 0.1 g in *water R* with gentle heating and dilute to 10 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Optical rotation (2.2.7). Dissolve 0.50 g in *methanol R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation is -0.05° to $+0.05^\circ$.

Absorbance (2.2.25). Dissolve 0.5 g in a mixture of equal volumes of *methanol R* and of *water R* with heating, if necessary, at 30 °C to 35 °C and dilute to 25 ml with the same mixture of solvents. Cool quickly. Measure the absorbance immediately at 480 nm. The absorbance is not greater than 0.04.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g in a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A and dilute to 20.0 ml with the same mixture of mobile phases.

Reference solution (a). Dilute 4.0 ml of the test solution to 100.0 ml with a 0.05 g/l solution of *anisaldehyde R* in a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. Dissolve 2.60 g of *sodium octanesulphonate R* in 1000 ml of *water R* and add 3 ml of *triethylamine R*; adjust to pH 2.5 with *phosphoric acid R*,

Mobile phase B. A mixture of 18 volumes of *acetonitrile R* and 82 volumes of *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	65	35
5 - 20	65 → 20	35 → 80
20 - 25	20	80

- as detector a spectrophotometer set at 280 nm.

Inject 20 µl of reference solution (a). The test is not valid unless the resolution between the peaks corresponding to *dobutamine hydrochloride* and *anisaldehyde* is at least 4.0. Inject 20 µl of the test solution and 20 µl of reference solution (b). In the chromatogram obtained with the test solution: any peak apart from the principal peak is not greater than the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); and the sum of the areas of all the peaks apart from the principal peak is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (b) (1 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.250 g in 10 ml of *anhydrous formic acid R*. Add 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 33.79 mg of $C_{18}H_{24}ClNO_3$.

STORAGE

Store protected from light.

IMPURITIES

A. dopamine,

B. 4-(4-hydroxyphenyl)butan-2-one,

C. (2*RS*)-*N*-[2-(3,4-dimethoxyphenyl)ethyl]-4-(4-methoxyphenyl)butan-2-amine.

01/2005:1418

DOCUSATE SODIUM

Natrii docusas

 $C_{20}H_{37}NaO_7S$
 M_r 444.6

DEFINITION

Sodium 1,4-bis[(2-ethylhexyl)oxy]-1,4-dioxobutane-2-sulphonate.

Content: 98.0 to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, waxy masses or flakes, hygroscopic.

Solubility: sparingly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: place about 3 mg of the substance to be examined on a sodium chloride plate, add 0.05 ml of *acetone R* and immediately cover with another sodium chloride plate. Rub the plates together to dissolve the substance to be examined, slide the plates apart and allow the acetone to evaporate.

Comparison: *Ph. Eur. reference spectrum of docusate sodium*.

B. In a crucible, ignite 0.75 g in the presence of *dilute sulphuric acid R*, until an almost white residue is obtained. Allow to cool and take up the residue with 5 ml of *water R*. Filter. 2 ml of the filtrate gives reaction (a) of sodium (2.3.1).

TESTS

Alkalinity. Dissolve 1.0 g in 100 ml of a mixture of equal volumes of *methanol R* and *water R*, previously neutralised to *methyl red solution R*. Add 0.1 ml of *methyl red solution R*. Not more than 0.2 ml of 0.1 *M hydrochloric acid* is required to change the colour of the indicator to red.

Related non-ionic substances. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 10 mg of *methyl behenate R* in *hexane R* and dilute to 50 ml with the same solvent.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 2.0 ml of the internal standard solution and dilute to 5.0 ml with *hexane R*. Pass the solution, at a rate of about 1.5 ml/min, through a column 10 mm in internal diameter, packed with 5 g of *basic aluminium oxide R* and previously washed with 25 ml of *hexane R*. Elute with 5 ml of *hexane R* and discard the eluate. Elute with 20 ml

of a mixture of equal volumes of *ether R* and *hexane R*. Evaporate the eluate to dryness and dissolve the residue in 2.0 ml of *hexane R*.

Test solution (b). Prepare as described for test solution (a) but dissolving 0.10 g of the substance to be examined in *hexane R*, diluting to 5.0 ml with the same solvent, and using a new column.

Reference solution. Dilute 2.0 ml of the internal standard solution to 5.0 ml with *hexane R*.

Column:

- *material*: glass,
- *size*: $l = 2$ m, $\varnothing = 2$ mm,
- *stationary phase*: silanised diatomaceous earth for gas chromatography *R* impregnated with 3 per cent *m/m* of polymethylphenylsiloxane *R*.

Carrier gas: nitrogen for chromatography *R*.

Flow rate: 30 ml/min.

Temperature:

- *column*: 230 °C,
- *injection port and detector*: 280 °C.

Detection: flame ionisation.

Injection: 1 µl.

Run time: 2.5 times the retention time of the internal standard.

System suitability: there is no peak with the same retention time as the internal standard in the chromatogram obtained with test solution (b).

Limits: test solution (a):

- *any impurity*: for each impurity, not more than the area of the peak due to the internal standard (0.4 per cent).

Chlorides: maximum 350 ppm.

Dissolve 5.0 g in 50 ml of *alcohol (50 per cent V/V) R* and add 0.1 ml of *potassium dichromate solution R*. Not more than 0.5 ml of 0.1 *M silver nitrate* is required to change the colour of the indicator from yellow to orange.

Sodium sulphate: maximum 2 per cent.

Dissolve 0.25 g in 40 ml of a mixture of 20 volumes of *water R* and 80 volumes of 2-propanol *R*. Adjust to pH between 2.5 and 4.0 using *perchloric acid solution R*. Add 0.4 ml of *naphtharson solution R* and 0.1 ml of a 0.125 g/l solution of *methylene blue R*. Not more than 1.5 ml of 0.025 *M barium perchlorate* is required to change the colour of the indicator from yellowish-green to yellowish-pink.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 4.0 g in *alcohol (80 per cent V/V) R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with *alcohol (80 per cent V/V) R*.

Water (2.5.12): maximum 3.0 per cent, determined on 0.250 g.

ASSAY

To 1.000 g in a 250 ml conical flask fitted with a reflux condenser add 25.0 ml of 0.5 *M alcoholic potassium hydroxide* and heat on a water-bath under reflux for 45 min. Allow to cool. Add 0.25 ml of *phenolphthalein solution R1* and titrate with 0.5 *M hydrochloric acid* until the red colour disappears. Carry out a blank titration.

1 ml of 0.5 *M hydrochloric acid* is equivalent to 0.1112 g of $C_{20}H_{37}NaO_7S$.

STORAGE

In an airtight container.

DODECYL GALLATE

Dodecylis gallas

 $C_{19}H_{30}O_5$ M_r 338.4**DEFINITION**

Dodecyl 3,4,5-trihydroxybenzoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).**CHARACTERS***Appearance*: white or almost white, crystalline powder.*Solubility*: very slightly soluble or practically insoluble in water, freely soluble in ethanol (96 per cent), slightly soluble in methylene chloride.**IDENTIFICATION****A. Melting point (2.2.14).**

Determine the melting point of the substance to be examined. Mix equal parts of the substance to be examined and *dodecyl gallate CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 96 °C) is not greater than 2 °C.

B. Examine the chromatograms obtained in the test for impurity A.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS**Impurity A.** Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *dodecyl gallate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *gallic acid R* in *acetone R* and dilute to 20 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10 ml with *acetone R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 5 ml with test solution (a).

Plate: TLC silica gel plate *R*.

Mobile phase: anhydrous formic acid *R*, ethyl formate *R*, toluene *R* (10:40:50 V/V/V).

Application: 5 µl of test solutions (a) and (b) and reference solutions (a), (c) and (d).

Development: over 2/3 of the plate.

Drying: in air for 10 min.

Detection: spray with a mixture of 1 volume of *ferric chloride solution R1* and 9 volumes of *ethanol (96 per cent) R*.

System suitability: reference solution (d):

- the chromatogram shows 2 clearly separated principal spots.

Limit: test solution (a):

- *impurity A*: any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Chlorides (2.4.4): maximum 100 ppm.

To 1.65 g add 50 ml of *water R*. Shake for 5 min. Filter. 15 ml of the filtrate complies with the test.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 70 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 200.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the absorption maximum at 275 nm.

Calculate the content of $C_{19}H_{30}O_5$ taking the specific absorbance to be 321.

STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A.

A. 3,4,5-trihydroxybenzoic acid (gallic acid).

01/2005:1510

DOG ROSE

Rosae pseudo-fructus

DEFINITION

Dog rose consists of the rose hips made up by the receptacle and the remains of the dried sepals of *Rosa canina* L., *R. pendulina* L. and other *Rosa* species, with the achenes removed. It contains not less than 0.3 per cent of ascorbic acid ($C_6H_8O_6$; M_r 176.1), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- It consists of fragments of the fleshy, hollow, urceolate receptacle, bearing the remains of the reduced sepals, light pink to orange-pink, the convex outer surface shiny and strongly wrinkled; bearing on its lighter inner surface abundant bristle-like hairs.
- Reduce to a powder (355). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous fragments of receptacle, the outer epidermis with orange-yellow

contents and a thick cuticle, the inner epidermis composed of thin-walled cells containing cluster crystals and occasional prisms of calcium oxalate; scattered lignified cells, isodiametric, with thickened and pitted walls forming the trichome bases; abundant long, unicellular trichomes, up to 2 mm long and 30 µm to 45 µm thick, tapering towards each end, walls heavily thickened and with a waxy cuticle which may show fissures in a spiral arrangement; numerous oily orange-yellow globules.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. To 5 g of the powdered drug (355) add 25 ml of *alcohol R*. Shake for 30 min and filter.

Reference solution. Dissolve 10 mg of *ascorbic acid R* in 5.0 ml of *alcohol (60 per cent V/V) R*.

Apply to the plate 20 µl of the test solution and 2 µl of the reference solution. Develop over a path of 15 cm using a mixture of 5 volumes of *acetic acid R*, 5 volumes of *acetone R*, 20 volumes of *methanol R* and 70 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows a quenching zone similar in position to the principal zone in the chromatogram obtained with the reference solution. Spray with a 0.2 g/l solution of *dichlorophenolindophenol, sodium salt R* in *alcohol R*. Examine in daylight. The chromatogram obtained with the test solution shows a white zone on a pink background similar in position and colour to the principal zone in the chromatogram obtained with the reference solution. The chromatogram also shows an intense orange-yellow zone near the solvent front and a yellow zone in the upper third (carotenoids).

TESTS

Foreign matter (2.8.2). Not more than 1 per cent.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100–105 °C.

Total ash (2.4.16). Not more than 7.0 per cent.

ASSAY

Test solution. In a round-bottomed flask, weigh 0.500 g of the freshly powdered drug (710). Add a solution of 1.0 g of *oxalic acid R* in 50.0 ml of *methanol R*. Boil under a reflux condenser for 10 min, and cool in iced water until the temperature reaches 15 °C to 20 °C. Filter. Transfer 2.0 ml of the filtrate to a 50 ml conical flask. Add successively, with gentle shaking after each addition, 2.0 ml of *dichlorophenolindophenol standard solution R* and then, exactly 60 s later, 0.5 ml of a 100 g/l solution of *thiourea R* in *alcohol (50 per cent V/V) R* and 0.7 ml of *dinitrophenylhydrazine-sulphuric acid solution R*. Heat under a reflux condenser at 50 °C for 75 min, and place immediately in iced water for 5 min. Add dropwise 5.0 ml of a mixture of 12 ml of *water R* and 50 ml of *sulphuric acid R*, taking care to carry out the addition over a period of not less than 90 s and not more than 120 s while maintaining vigorous stirring in iced water. Allow to stand for 30 min at room temperature and measure the absorbance (2.2.25) at 520 nm using solution A as compensation liquid.

Solution A. Treat 2.0 ml of the filtrate obtained during the preparation of the test solution as described but adding the *dinitrophenylhydrazine-sulphuric acid solution R* just before the absorbance is measured.

Reference solution. Dissolve 40.0 mg of *ascorbic acid R* in a freshly prepared 20 g/l solution of *oxalic acid R* in *methanol R* and dilute to 100.0 ml with the same

solvent. Dilute 5.0 ml of the solution to 100.0 ml with the methanolic solution of oxalic acid. Treat 2.0 ml of the solution as described above for the filtrate obtained during the preparation of the test solution. Measure the absorbance (2.2.25) at 520 nm using solution B as compensation liquid.

Solution B. Treat 2.0 ml of the reference solution as described above for solution A.

Calculate the percentage content of ascorbic acid from the expression:

$$\frac{2.5 \times A_1 \times m_2}{A_2 \times m_1}$$

A_1 = absorbance of the test solution,

A_2 = absorbance of the reference solution,

m_1 = mass of the substance to be examined, in grams,

m_2 = mass of ascorbic acid used, in grams.

01/2005:1009

DOMPERIDONE

Domperidonum

$C_{22}H_{24}ClN_5O_2$

M_r 425.9

DEFINITION

Domperidone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-chloro-1-[1-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, soluble in dimethylformamide, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 244 °C to 248 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *domperidone CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a suitable octadecylsilyl silica gel as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *domperidone CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *domperidone CRS* and 20 mg of *droperidol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *ammonium acetate solution R*, 40 volumes of *dioxan R* and 40 volumes of *methanol R*. Dry the plate in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.20 g in *dimethylformamide R* and dilute to 20.0 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.10 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *domperidone CRS* and 15.0 mg of *droperidol CRS* in *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide R*. Dilute 5.0 ml of this solution to 20.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 3 volumes *methanol R* and 7 volumes of a 5 g/l solution of *ammonium acetate R*, changing by linear gradient to *methanol R* over 10 min, followed by elution with *methanol R* for 2 min,
- as detector a spectrophotometer set at 280 nm.

Equilibrate the column for at least 30 min with *methanol R* and then equilibrate at the initial mobile phase composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: domperidone about 6.5 min; droperidol about 7 min. The test is not valid unless the resolution between the peaks due to domperidone and droperidol is at least 2.0. If necessary, adjust the concentration of methanol in the mobile phase or adjust the time programme for the linear gradient.

Inject separately 10 µl of *dimethylformamide R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per

cent). Disregard any peak in the chromatogram obtained with the blank run and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid* until the colour changes from orange-yellow to green using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 42.59 mg of C₂₂H₂₄ClN₅O₂.

STORAGE

Store protected from light.

IMPURITIES

A. 5-chloro-1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one,

B. 4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)-1-formylpiperidine,

C. *cis*-4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)-1-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]piperidine 1-oxide,

D. 5-chloro-3-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]-1-[1-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

- E. 1-[3-[4-(5-chloro-2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)piperidin-1-yl]propyl]-3-[3-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)propyl]-1,3-dihydro-2*H*-benzimidazol-2-one,

- F. 1,3-bis[3-[4-(5-chloro-2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)piperidin-1-yl]propyl]-1,3-dihydro-2*H*-benzimidazol-2-one.

DOMPERIDONE MALEATE

Domperidoni maleas

C₂₆H₂₈ClN₅O₆

M_r 542.0

DEFINITION

Domperidone maleate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-chloro-1-[1-[3-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one hydrogen (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, sparingly soluble in dimethylformamide, slightly soluble in methanol, very slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with domperidone maleate CRS. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of 2-propanol R, evaporate to dryness on a water-bath and record new spectra using the residues.

- B. Examine by thin-layer chromatography (2.2.27), using a suitable octadecylsilyl silica gel as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in methanol R and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of domperidone maleate CRS in methanol R and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of domperidone maleate CRS and 20 mg of droperidol CRS in methanol R and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of ammonium acetate solution R, 40 volumes of dioxan R and 40 volumes of methanol R. Dry the plate in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Triturate 0.1 g with a mixture of 1 ml of strong sodium hydroxide solution R and 3 ml of water R. Shake with three quantities, each of 5 ml, of ether R. To 0.1 ml of the aqueous layer add a solution of 10 mg of resorcinol R in 3 ml of sulphuric acid R. Heat on a water-bath for 15 min. No colour develops. To the remainder of the aqueous layer add 2 ml of bromine solution R. Heat on a water-bath for 15 min and then heat to boiling. Cool. To 0.1 ml of the solution add a solution of 10 mg of resorcinol R in 3 ml of sulphuric acid R. Heat on a water-bath for 15 min. A violet colour develops.

TESTS

Appearance of solution. Dissolve 0.20 g in dimethylformamide R and dilute to 20.0 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.10 g of the substance to be examined in dimethylformamide R and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of domperidone maleate CRS and 15.0 mg of droperidol CRS in dimethylformamide R and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with dimethylformamide R. Dilute 5.0 ml of this solution to 20.0 ml with dimethylformamide R.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with base-deactivated octadecylsilyl silica gel for chromatography R (3 µm),
- as mobile phase at a flow rate of 1.5 ml per minute of a mixture of 3 volumes of methanol R and 7 volumes of a 5 g/l solution of ammonium acetate R, changing by linear gradient to methanol R over 10 min, followed by elution with methanol R for 2 min,
- as detector a spectrophotometer set at 280 nm.

Equilibrate the column for at least 30 min with methanol R and then equilibrate at the initial mobile phase composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: domperidone maleate, about 6.5 min and droperidol, about 7 min. The test is not valid unless the resolution between the peaks due to domperidone maleate and droperidol is at least 2.0. If necessary, adjust the concentration of methanol in the mobile phase or adjust the time programme for the linear gradient.

Inject 10 µl of *dimethylformamide R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak in the chromatogram obtained with the blank run, any peak due to maleic acid at the beginning of the chromatogram and any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Using 0.2 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from orange-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 54.20 mg of C₂₆H₂₈ClN₅O₆.

STORAGE

Store protected from light.

IMPURITIES

- A. 5-chloro-1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one,

- B. 4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)-1-formylpiperidine,

- C. *cis*-4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)-1-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]piperidine 1-oxide,

- D. 5-chloro-3-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]-1-[1-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

- E. 1-[3-[4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)piperidin-1-yl]propyl]-3-[3-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)propyl]-1,3-dihydro-2H-benzimidazol-2-one,

- F. 1,3-bis[3-[4-(5-chloro-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)piperidin-1-yl]propyl]-1,3-dihydro-2H-benzimidazol-2-one.

01/2005:0664

DOPAMINE HYDROCHLORIDE

Dopamini hydrochloridum

C₈H₁₂ClNO₂

M_r 189.6

DEFINITION

Dopamine hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 4-(2-aminoethyl)benzene-1,2-diol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, soluble in alcohol, sparingly soluble in acetone and in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 40.0 mg in 0.1 M hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.1 M hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 280 nm. The specific absorbance at the maximum is 136 to 150.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with dopamine hydrochloride CRS. Examine the substances as discs prepared using potassium chloride R.
- C. Dissolve about 5 mg in a mixture of 5 ml of 1 M hydrochloric acid and 5 ml of water R. Add 0.1 ml of sodium nitrite solution R containing 100 g/l of ammonium molybdate R. A yellow colour develops which becomes red on the addition of strong sodium hydroxide solution R.
- D. Dissolve about 2 mg in 2 ml of water R and add 0.2 ml of ferric chloride solution R2. A green colour develops which changes to bluish-violet on the addition of 0.1 g of hexamethylenetetramine R.
- E. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.4 g in water R and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₆ or Y₆ (2.2.2, Method II).

Acidity or alkalinity. Dissolve 0.5 g in carbon dioxide-free water R and dilute to 10 ml with the same solvent. Add 0.1 ml of methyl red solution R and 0.75 ml of 0.01 M sodium hydroxide. The solution is yellow. Add 1.5 ml of 0.01 M hydrochloric acid. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

Test solution. Dissolve 0.15 g of the substance to be examined in methanol R and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 7.5 mg of 4-O-methyldopamine hydrochloride R in methanol R and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 7.5 mg each of 3-O-methyldopamine hydrochloride R and 4-O-methyldopamine hydrochloride R in methanol R and dilute to 100 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of anhydrous formic acid R, 7 volumes of water R, 36 volumes of methanol R and 52 volumes of chloroform R. Allow the plate to dry in air for 15 min. Spray evenly and abundantly with a mixture of equal volumes of potassium ferricyanide solution R and ferric chloride solution R1, prepared immediately before use. Any spot in the chromatogram obtained with the test solution with an R_f value higher than that of the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.1500 g in 10 ml of anhydrous formic acid R. Add 50 ml of acetic anhydride R. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M perchloric acid is equivalent to 18.96 mg of C₈H₁₂ClNO₂.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. 5-(2-aminoethyl)-2-methoxyphenol (4-O-methyldopamine).

01/2005:1314

DOSULEPIN HYDROCHLORIDE

Dosulepini hydrochloridum

C₁₉H₂₂ClNSM_r 331.9

DEFINITION

(E)-3-(Dibenzo[b,e]thiepin-11(6H)-ylidene)-N,N-dimethylpropan-1-amine hydrochloride.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or faintly yellow, crystalline powder.

Solubility: freely soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 25.0 mg in a 1 g/l solution of hydrochloric acid R in methanol R and dilute to 100.0 ml with the same solution. Dilute 2.0 ml to 50.0 ml with a 1 g/l solution of hydrochloric acid R in methanol R. Examined between 220 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima at 231 nm and 306 nm and a shoulder at about 260 nm. The specific absorbance at the maximum at 231 nm is 660 to 730.
- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: dosulepin hydrochloride CRS.

- C. Dissolve about 1 mg in 5 ml of sulphuric acid R. A dark red colour is produced.
- D. It gives reaction (b) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

Dissolve 1 g in *water R* and dilute to 20 ml with the same solvent.

pH (2.2.3): 4.2 to 5.2.

Dissolve 1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Impurity E and related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 50.0 mg of the substance to be examined in 5 ml of *methanol R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 12.5 mg of *dosulepin impurity A CRS* in 5 ml of *methanol R* and dilute to 50.0 ml with the mobile phase. Dilute 0.5 ml to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *dosulepin hydrochloride CRS* in 5 ml of *methanol R* and dilute to 20.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** nitrile silica gel for chromatography R1 (5 μ m),
- **temperature:** 35 °C.

Mobile phase: 0.83 per cent V/V solution of *perchloric acid R*, *propanol R*, *methanol R*, *water R* (1:10:30:60 V/V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 229 nm.

Injection: 5 μ l.

Run time: 2.5 times the retention time of dosulepin (*E*-isomer).

Relative retention with reference to dosulepin (*E*-isomer; retention time = about 25 min): impurity E = about 0.9.

System suitability: reference solution (b):

- **peak-to-valley ratio:** minimum 4, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to dosulepin (*E*-isomer).

Limits:

- **impurity E:** not more than 5 per cent of the sum of the areas of the peak due to impurity E and the principal peak in the chromatogram obtained with the test solution,
- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent),
- **any other impurity:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total of other impurities and impurity A:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5 ml of *anhydrous acetic acid R* and 35 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 33.19 mg of C₁₉H₂₂CIN₃.

STORAGE

Protected from light.

IMPURITIES

A. X = SO: (*E*)-3-(5-oxo-5 λ^4 -dibenzo[*b,e*]thiepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine,

D. X = SO₂: (*E*)-3-(5,5-dioxo-5 λ^6 -dibenzo[*b,e*]thiepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine,

B. R + R' = O: dibenzo[*b,e*]thiepin-11(6*H*)-one,

C. R = OH, R' = [CH₂]₃-N(CH₃)₂: (11*RS*)-11-[3-(dimethylamino)propyl]-6,11-dihydrodibenzo[*b,e*]thiepin-11-ol,

E. (*Z*)-3-(dibenzo[*b,e*]thiepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine.

01/2005:1201 **Optical rotation** (2.2.7): -0.10° to $+0.10^{\circ}$, determined on solution S.

DOXAPRAM HYDROCHLORIDE

Doxaprami hydrochloridum

$C_{24}H_{31}ClN_2O_2 \cdot H_2O$

M_r 433.0

DEFINITION

(4*RS*)-1-Ethyl-4-[2-(morpholin-4-yl)ethyl]-3,3-diphenylpyrrolidin-2-one hydrochloride.

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: doxapram hydrochloride CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *doxapram hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: solution of *ammonia R* containing 17 g/l of NH_3 , 2-propanol *R*, 2-methylpropanol *R* (10:10:80 V/V/V).

Application: 10 μ l.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *dilute potassium iodobismuthate solution R* and examine immediately.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.500 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dilute 10 ml of solution S to 25 ml with *water R*.

pH (2.2.3): 3.5 to 5.0.

Dilute 5 ml of solution S to 25 ml with *carbon dioxide-free water R*.

Related substances. Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *doxapram impurity B CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a carbon loading of 14 per cent, a specific surface area of 350 m²/g and a pore size of 10 nm.

Mobile phase: mix 50 volumes of *acetonitrile R* and 50 volumes of a 0.82 g/l solution of *sodium acetate R* adjusted to pH 4.5 with *glacial acetic acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 μ l.

Run time: 4 times the retention time of doxapram.

Retention time: doxapram = about 6 min.

System suitability: reference solution (c):

- **resolution:** minimum of 3.0 between the peaks corresponding to doxapram and to impurity B.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Loss on drying (2.2.32): 3.0 per cent to 4.5 per cent, determined on 1.000 g by drying in an oven at 100–105 $^{\circ}$ C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of 0.01 *M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20) using 0.1 *M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 41.50 mg of $C_{24}H_{31}ClN_2O_2$.

IMPURITIES

- A. R = Cl: (4RS)-4-(2-chloroethyl)-1-ethyl-3,3-diphenylpyrrolidin-2-one,
 B. R = NH-CH₂-CH₂-OH: (4RS)-1-ethyl-4-[2-[(2-hydroxyethyl)amino]ethyl]-3,3-diphenylpyrrolidin-2-one.

DOXEPIN HYDROCHLORIDE

Doxepini hydrochloridum

C₁₉H₂₂ClNO

M_r 315.8

DEFINITION

Doxepin hydrochloride is (*E*)-3-(dibenzo[*b,e*]oxepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine hydrochloride. It contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of C₁₉H₂₂ClNO, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 185 °C to 191 °C.
 B. Dissolve 50.0 mg in a 1 g/l solution of *hydrochloric acid R* in *methanol R* and dilute to 100.0 ml with the same acid solution. Dilute 5.0 ml to 50.0 ml with a 1 g/l solution of *hydrochloric acid R* in *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 297 nm. The specific absorbance at the maximum is 128 to 142.
 C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of doxepin hydrochloride*.
 D. Dissolve about 5 mg in 2 ml of *sulphuric acid R*. A dark red colour is produced.
 E. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.5 g in *carbon dioxide-free water R* and dilute to 30 ml with the same solvent.

Appearance of solution. Dilute 10 ml of solution S to 25 ml with *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 0.1 ml of *methyl red solution R*. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R* (2-10 µm) with a concentration zone.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *doxepin impurity A CRS* in *methanol R*, add 1 ml of the test solution and dilute to 10 ml with *methanol R*. Dilute 1.0 ml of this solution to 50 ml with *methanol R*.

Reference solution (b). Dissolve 10.0 mg of *doxepin impurity B CRS* in *methanol R*, add 1 ml of the test solution and dilute to 10 ml with *methanol R*. Dilute 1.0 ml of this solution to 50 ml with *methanol R*.

Reference solution (c). Dissolve 10.0 mg of *doxepin impurity B CRS* in *methanol R* and dilute to 200 ml with the same solvent.

Apply to one plate (plate A) 2 µl of the test solution and 2 µl of reference solution (a). Develop over a path of 5 cm using a mixture of 30 volumes of *methyl ethyl ketone R* and 60 volumes of *heptane R*. Doxepin remains on the starting line.

Apply to another plate (plate B) 2 µl of the test solution and 2 µl of reference solutions (b) and (c). Develop over a path of 5 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*.

Allow the plates to dry in a current of air. Spray with a solution prepared as follows: dissolve 20 g of *zinc chloride R* in 30 ml of *glacial acetic acid R*, add 3 ml of *phosphoric acid R* and 0.80 ml of *strong hydrogen peroxide solution R* and dilute to 60 ml with *water R*. Heat the plates at 120 °C for 15 min and examine immediately in ultraviolet light at 365 nm.

Plate A. In the chromatogram obtained with the test solution: any spot corresponding to impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.2 per cent); any spot, apart from the principal spot and the spot corresponding to impurity A, is not more intense than the spots in the chromatogram obtained with reference solution (a) (0.2 per cent).

Plate B. In the chromatogram obtained with the test solution: any spot corresponding to impurity C (*R_f* about 0.12) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent); any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.2 per cent); any spot, apart from the principal spot, the spot corresponding to impurity B or the spot corresponding to impurity C, is not more intense than the spots in the chromatogram obtained with reference solution (b) (0.2 per cent).

The test is not valid unless the chromatograms obtained with reference solutions (a) and (b) show clearly visible and separated principal spots.

Z-Isomer. 13.0 per cent to 18.5 per cent of the *Z*-isomer, determined by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the

mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4 mm in internal diameter packed with spherical *octylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 220 m²/g and a pore size of 80 nm,
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of *methanol R* and 70 volumes of a 30 g/l solution of *sodium dihydrogen phosphate R*, previously adjusted to pH 2.5 with *phosphoric acid R*,
- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 50 °C.

Inject 20 µl of the test solution. Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (*E*-isomer) and the second peak (*Z*-isomer) is at least 1.5.

The ratio of the area of the peak due to the *E*-isomer to the area of the peak due to the *Z*-isomer is 4.4 to 6.7.

Heavy metals (2.4.8). 1.0 g complies with limit test D (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5 ml of *anhydrous acetic acid R* and 35 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* until the colour changes from blue to green, using 0.2 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 31.58 mg of C₂₇H₂₂ClNO₁₁.

STORAGE

Protected from light.

IMPURITIES

A. dibenzo[*b,e*]oxepin-11(6*H*)-one,

and enantiomer

B. (11*RS*)-11-[3-(dimethylamino)propyl]-6,11-dihydrodibenzo[*b,e*]oxepin-11-ol,

C. (*E*)-3-(dibenzo[*b,e*]oxepin-11(6*H*)-ylidene)-*N*-methylpropan-1-amine,

D. (*Z*)-3-(dibenzo[*b,e*]oxepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine.

01/2005:0714

DOXORUBICIN HYDROCHLORIDE

Doxorubicini hydrochloridum

C₂₇H₃₀ClNO₁₁

M_r 580.0

DEFINITION

(8*S*,10*S*)-10-[(3-Amino-2,3,6-trideoxy-α-*L*-lyxo-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione hydrochloride.

Substance produced by certain strains of *Streptomyces coeruleorubidus* or *Streptomyces peucetius* or obtained by any other means.

Content: 98.0 per cent to 102.0 per cent (anhydrous, solvent-free substance).

CHARACTERS

Appearance: orange-red, crystalline powder, hygroscopic.

Solubility: soluble in water, slightly soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *doxorubicin hydrochloride CRS*.

B. Dissolve about 10 mg in 0.5 ml of *nitric acid R*, add 0.5 ml of *water R* and heat over a flame for 2 min. Allow to cool and add 0.5 ml of *silver nitrate solution R1*. A white precipitate is formed.

TESTS

pH (2.2.3): 4.0 to 5.5.

Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).
Prepare the solutions immediately before use.

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *doxorubicin hydrochloride CRS* and 10 mg of *epirubicin hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 50.0 mg of *doxorubicin hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.0$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix equal volumes of acetonitrile R and a solution containing 2.88 g/l of sodium laurilsulfate R and 2.25 g/l of phosphoric acid R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 5 μ l; inject test solution (a) and reference solutions (a) and (b).

Run time: 3.5 times the retention time of doxorubicin.

Retention time: doxorubicin = about 8 min.

System suitability: reference solution (a):

- resolution: minimum of 2.0 between the peaks due to doxorubicin and to epirubicin.

Limits:

- any impurity: not more than the area of the peak corresponding to doxorubicin in the chromatogram obtained with reference solution (b) (0.5 per cent),
- disregard limit: 0.1 times the area of the peak corresponding to doxorubicin in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ethanol (2.4.24, System B): maximum 1.0 per cent.

Water (2.5.12): maximum 4.0 per cent, determined on 0.100 g.

Bacterial endotoxins (2.6.14): less than 2.2 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{27}H_{30}ClNO_{11}$.

STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. daunorubicin,

B. R = OCH₃: (8S,10S)-10[(3-amino-2,3,6-trideoxy-α-L-lyxohexopyranosyl)oxy]-8-(2-bromo-1,1-dimethoxyethyl)-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione,

C. R + R = O: (8S,10S)-10[(3-amino-2,3,6-trideoxy-α-L-lyxohexopyranosyl)oxy]-8-(bromoacetyl)-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione,

D. (8S,10S)-6,8,10,11-tetrahydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicin aglycone, doxorubicinone).

01/2005:0272

DOXYCYCLINE HYCLATE

Doxycyclini hyclas

$(C_{22}H_{25}ClN_2O_8), 1/2 C_2H_6O, 1/2 H_2O$

M_r 512.9

DEFINITION

Hydrochloride hemiethanol hemihydrate of (4S,4aR,5S,5aR,6R,12aS)-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide.

Substance obtained from oxytetracycline or metacycline or by any other means.

Content: 95.0 per cent to 102.0 per cent of $C_{22}H_{25}ClN_2O_8$ (anhydrous and ethanol-free substance).

CHARACTERS

Appearance: yellow, crystalline powder, hygroscopic.

Solubility: freely soluble in water and in methanol, sparingly soluble in ethanol (96 per cent). It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A yellow colour develops.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 2.0 to 3.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): – 105 to – 120 (anhydrous and ethanol-free substance).

Dissolve 0.250 g in a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 25.0 ml with the same mixture of solvents. Carry out the measurement within 5 min of preparing the solution.

Specific absorbance (2.2.25): 300 to 335, determined at the absorption maximum at 349 nm (anhydrous and ethanol-free substance).

Dissolve 25.0 mg in a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 25.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 100.0 ml with a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R*. Carry out the measurement within 1 h of preparing the solution.

Light-absorbing impurities. The absorbance (2.2.25), determined at 490 nm is maximum 0.07 (anhydrous and ethanol-free substance).

Dissolve 0.10 g in a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents. Carry out the measurement within 1 h of preparing the solution.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 20.0 mg of the substance to be examined in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 20.0 mg of *doxycycline hyclate CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 20.0 mg of 6-epidoxycycline hydrochloride CRS in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (c). Dissolve 20.0 mg of *metacycline hydrochloride CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (d). Mix 4.0 ml of reference solution (a), 1.5 ml of reference solution (b) and 1.0 ml of reference solution (c) and dilute to 25.0 ml with 0.01 *M hydrochloric acid*.

Reference solution (e). Mix 2.0 ml of reference solution (b) and 2.0 ml of reference solution (c) and dilute to 100.0 ml with 0.01 *M hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (8 μ m),
- temperature: 60 °C.

Mobile phase: weigh 60.0 g of 2-methyl-2-propanol *R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*; add 400 ml of *buffer solution pH 8.0 R*, 50 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 8.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 8.0 with *dilute sodium hydroxide solution R*; dilute to 1000.0 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l of the test solution and reference solutions (d) and (e).

Relative retention with reference to doxycycline: impurity E = about 0.2; impurity D = about 0.3; impurity C = about 0.5; impurity F = about 1.2.

System suitability: reference solution (d):

- resolution: minimum 1.25 between the peaks due to impurity B (1st peak) and impurity A (2nd peak) and minimum 2.0 between the peaks due to impurity A and doxycycline (3rd peak); if necessary, adjust the 2-methyl-2-propanol content in the mobile phase;
- symmetry factor: maximum 1.25 for the peak due to doxycycline.

Limits:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (2.0 per cent),
- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (2.0 per cent),
- impurities C, D, E, F: for each impurity, not more than 0.25 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.5 per cent),
- any other impurity: for each impurity, not more than 0.25 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.5 per cent),
- disregard limit: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.1 per cent).

Ethanol. Gas chromatography (2.2.28).

Internal standard solution. Dilute 0.50 ml of *propanol R* to 1000.0 ml with *water R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 0.10 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the same solution.

Reference solution. Dilute 0.50 ml of *ethanol R* to 100.0 ml with the internal standard solution. Dilute 1.0 ml of this solution to 10.0 ml with the internal standard solution.

Column:

- size: $l = 1.5$ m, $\varnothing = 4.0$ mm,
- stationary phase: *ethylvinylbenzene-divinylbenzene copolymer R* (150–180 μ m).

Carrier gas: *nitrogen for chromatography R*.

Temperature:

- column: 135 °C,
- injection port and detector: 150 °C.

Detection: flame ionisation.

Calculate the content of ethanol taking the density (2.2.5) at 20 °C to be 0.790 g/ml.

Limit:

– *ethanol*: 4.3 per cent to 6.0 per cent.

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the reference solution using 2.5 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): 1.4 per cent to 2.8 per cent, determined on 1.20 g.

Sulphated ash (2.4.14): maximum 0.4 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 1.14 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{25}ClN_2O_8$ ($M_r = 480.9$).

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

- A. $R_1 = NH_2$, $R_2 = R_5 = H$, $R_3 = N(CH_3)_2$, $R_4 = CH_3$:
(4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (6-epidoxycycline),
- B. $R_1 = NH_2$, $R_2 = H$, $R_3 = N(CH_3)_2$, $R_4 + R_5 = CH_2$:
(4*S*,4*aR*,5*S*,5*aR*,12*aS*)-4-(dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methylene-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (metacycline),
- C. $R_1 = NH_2$, $R_2 = N(CH_3)_2$, $R_3 = R_4 = H$, $R_5 = CH_3$:
(4*R*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-4-(dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-epidoxycycline),
- D. $R_1 = NH_2$, $R_2 = N(CH_3)_2$, $R_3 = R_5 = H$, $R_4 = CH_3$:
(4*R*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-*epi*-6-epidoxycycline),
- E. $R_1 = NH_2$, $R_2 = H$, $R_3 = N(CH_3)_2$, $R_4 = OH$, $R_5 = CH_3$:
oxytetracycline,
- F. $R_1 = CH_3$, $R_2 = R_4 = H$, $R_3 = N(CH_3)_2$, $R_5 = CH_3$:
(4*S*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-2-acetyl-4-(dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methyl-4*a*,5*a*,6,12*a*-tetrahydrotetracene-1,11-(4*H*,5*H*)-dione (2-acetyl-2-decarbamoxyldoxycycline).

DOXYCYCLINE MONOHYDRATE

Doxycyclinum monohydricum

$C_{22}H_{24}N_2O_8 \cdot H_2O$

M_r 462.5

DEFINITION

(4*S*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-4-(Dimethylamino)-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide monohydrate.

Substance obtained from oxytetracycline or metacycline or by any other means.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water and in alcohol. It dissolves in dilute solutions of mineral acids and in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid* R. A yellow colour develops.

C. Dissolve 25 mg in a mixture of 0.2 ml of *dilute nitric acid* R and 1.8 ml of *water* R. The solution does not give reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 5.0 to 6.5.

Suspend 0.1 g in *carbon dioxide-free water* R and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): –113 to –130 (anhydrous substance).

Dissolve 0.250 g in a mixture of 0.5 volumes of *hydrochloric acid* R and 99.5 volumes of *methanol* R and dilute to 25.0 ml with the same mixture of solvents. Carry out the measurement within 5 min of preparing the solution.

Specific absorbance (2.2.25): 325 to 363 determined at the maximum at 349 nm (anhydrous substance).

Dissolve 25.0 mg in a mixture of 0.5 volumes of *hydrochloric acid* R and 99.5 volumes of *methanol* R and dilute to 50.0 ml with the same mixture of solvents. Dilute 2.0 ml of the solution to 100.0 ml with a mixture of 0.5 volumes of 1 *M* *hydrochloric acid* and 99.5 volumes of *methanol* R. Carry out the measurement within 1 h of preparing the solution.

Light-absorbing impurities. The absorbance (2.2.25) determined at 490 nm has a maximum of 0.07 (anhydrous substance).

Dissolve 0.10 g in a mixture of 0.5 volumes of *hydrochloric acid* R and 99.5 volumes of *methanol* R and dilute to

10.0 ml with the same mixture of solvents. Carry out the measurement within 1 h of preparing the solution.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 20.0 mg of the substance to be examined in 0.01 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 20.0 mg of *doxycycline hyclate* CRS in 0.01 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 20.0 mg of 6-epidoxycycline hydrochloride CRS in 0.01 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Reference solution (c). Dissolve 20.0 mg of *metacycline hydrochloride* CRS in 0.01 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Reference solution (d). Mix 4.0 ml of reference solution (a), 1.5 ml of reference solution (b) and 1.0 ml of reference solution (c) and dilute to 25.0 ml with 0.01 M hydrochloric acid.

Reference solution (e). Mix 2.0 ml of reference solution (b) and 2.0 ml of reference solution (c) and dilute to 100.0 ml with 0.01 M hydrochloric acid.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: styrene-divinylbenzene copolymer R (8 μ m),
- temperature: 60 °C.

Mobile phase: weigh 60.0 g of 2-methyl-2-propanol R and transfer into a 1000 ml volumetric flask with the aid of 200 ml of water R; add 400 ml of buffer solution pH 8.0 R, 50 ml of a 10 g/l solution of tetrabutylammonium hydrogen sulphate R adjusted to pH 8.0 with dilute sodium hydroxide solution R and 10 ml of a 40 g/l solution of sodium edetate R adjusted to pH 8.0 with dilute sodium hydroxide solution R; dilute to 1000.0 ml with water R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (d) and (e).

Relative retention with reference to doxycycline: impurity E = about 0.2; impurity D = about 0.3; impurity C = about 0.5; impurity F = about 1.2.

System suitability: reference solution (d):

- resolution: minimum 1.25 between the peaks due to impurity B (1st peak) and impurity A (2nd peak) and minimum 2.0 between the peaks due to impurity A and doxycycline (3rd peak); if necessary, adjust the 2-methyl-2-propanol content in the mobile phase,
- symmetry factor: maximum 1.25 for the peak due to doxycycline.

Limits:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (2.0 per cent),
- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (2.0 per cent),

- any other impurity: not more than 0.25 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.5 per cent),
- disregard limit: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.1 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the standard using 2.5 ml of lead standard solution (10 ppm Pb) R.

Water (2.5.12): 3.6 per cent to 4.6 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.4 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{24}N_2O_8$.

STORAGE

Protected from light.

IMPURITIES

- R1 = NH₂, R2 = R5 = H, R3 = N(CH₃)₂, R4 = CH₃: (4S,4aR,5S,5aR,6S,12aS)-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (6-epidoxycycline),
- R1 = NH₂, R2 = H, R3 = N(CH₃)₂, R4 + R5 = CH₂: (4S,4aR,5S,5aR,12aS)-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (metacycline),
- R1 = NH₂, R2 = N(CH₃)₂, R3 = R4 = H, R5 = CH₃: (4R,4aR,5S,5aR,6R,12aS)-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epidoxycycline),
- R1 = NH₂, R2 = N(CH₃)₂, R3 = R5 = H, R4 = CH₃: (4R,4aR,5S,5aR,6S,12aS)-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epi-6-epidoxycycline),
- R1 = NH₂, R2 = H, R3 = N(CH₃)₂, R4 = OH, R5 = CH₃: oxytetracycline,
- R1 = CH₃, R2 = R4 = H, R3 = N(CH₃)₂, R5 = CH₃: (4S,4aR,5S,5aR,6R,12aS)-2-acetyl-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4H,5H)-dione (2-acetyl-2-decarbamoyleldoxycycline).

01/2005:1589

DOXYLAMINE HYDROGEN SUCCINATE

Doxylamini hydrogenosuccinas

and enantiomer

 $C_{21}H_{28}N_2O_5$
 M_r 388.5

DEFINITION

N,N-dimethyl-2-[(1*RS*)-1-phenyl-1-(pyridin-2-yl)ethoxy]ethanamine hydrogen butanedioate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: a white or almost white powder.

Solubility: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B.

A. Melting point (2.2.14): 103 °C to 108 °C.

B. Dissolve 0.200 g in 0.1 M hydrochloric acid and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with 0.1 M hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 262 nm. The specific absorbance at the maximum is 229 to 243 (anhydrous substance).

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of doxylamine hydrogen succinate.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Dissolve 0.4 g of the substance to be examined in water R and dilute to 20 ml with the same solvent.

Optical rotation (2.2.7): - 0.10° to + 0.10°.

Dissolve 2.50 g of the substance to be examined in water R and dilute to 25.0 ml with the same solvent.

Related substances. Gas chromatography (2.2.28).

Test solution. Dissolve 0.650 g of the substance to be examined in 20 ml of 0.1 M hydrochloric acid. Add 3 ml of a 100 g/l solution of sodium hydroxide R and extract 3 times with 25 ml of methylene chloride R. Combine the methylene chloride extracts and filter using hydrophobic phase-separation filter paper. Rinse the filter with 10 ml of methylene chloride R and combine the rinsings with the methylene chloride extracts. Evaporate the solvent under reduced pressure at a temperature not exceeding 40 °C. Dissolve the residue in 20.0 ml of ethanol R.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with ethanol R.

Reference solution (b). Dissolve 40 mg of doxylamine impurity A CRS and 40 mg of 2-benzoylpyridine R in ethanol R and dilute to 20 ml with the same solvent. Dilute 1 ml of this solution to 20 ml with ethanol R.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.53$ mm,
- **stationary phase:** poly(dimethyl)(diphenyl)siloxane R (film thickness 1.5 μ m).

Carrier gas: helium for chromatography R.

Flow rate: 7 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12	160 → 220
	12 - 27	220
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 μ l.

System suitability: reference solution (b):

- **resolution:** minimum 1.5 between the peaks due to impurity A and impurity D.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): maximum 0.5 per cent, determined on 2.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 ml of anhydrous acetic acid R. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 19.43 mg of $C_{21}H_{28}N_2O_5$.

IMPURITIES

A. *N,N*-dimethyl-2-[(1*RS*)-1-phenyl-1-(pyridin-4-yl)ethoxy]ethanamine,

- B. R1 = CH₃, R2 = H: (1*RS*)-1-phenyl-1-(pyridin-2-yl)ethanol,
 C. R1 = H, R2 = CH₂-CH₂-N(CH₃)₂: *N,N*-dimethyl-2-[(*RS*)-1-phenyl(pyridin-2-yl)methoxy]ethanamine,

- D. phenyl(pyridin-2-yl)methanone (2-benzoylpyridine).

01/2005:1010

DROPERIDOL

Droperidolum

C₂₂H₂₂FN₃O₂M_r 379.4

DEFINITION

Droperidol contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[1-[4-(4-fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in dimethylformamide and in methylene chloride, sparingly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *droperidol CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness on a water-bath and record new spectra using the residues.

- B. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 30 mg of the substance to be examined in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of *droperidol CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 30 mg of *droperidol CRS* and 30 mg of *benperidol CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Dissolve about 10 mg in 5 ml of *ethanol R*. Add 0.5 ml of *dinitrobenzene solution R* and 0.5 ml of *2 M alcoholic potassium hydroxide R*. A violet colour is produced and becomes brownish-red after 20 min.
- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. Dissolve 0.20 g in *methylene chloride R* and dilute to 20.0 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.10 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *droperidol CRS* and 2.5 mg of *benperidol CRS* in *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide R*. Dilute 5.0 ml of this solution to 20.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min:
 - mobile phase A: acetonitrile R,*
 - mobile phase B: 10 g/l solution of tetrabutylammonium hydrogen sulphate R1,*

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	0 → 40	100 → 60
15 - 20	40	60
20 - 25	40 → 0	60 → 100

- as detector a spectrophotometer set at 275 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: benperidol about 6.5 min and droperidol about 7 min. The test is not valid unless the resolution between the peaks due to droperidol and benperidol is at least 2.0. If necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient. Inject 10 µl of *dimethylformamide R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Using 0.2 ml of *naphtholbenzein solution R*, titrate with 0.1 M *perchloric acid* until the colour changes from orange-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 37.94 mg of C₂₂H₂₂FN₃O₂.

STORAGE

Store protected from light.

IMPURITIES

- A. 1-(1,2,3,6-tetrahydropyridin-4-yl)-1,3-dihydro-2*H*-benzimidazol-2-one,

- B. 1-[1-[4-(2-fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one,

- C. 1-[4-(4-fluorophenyl)-4-oxobutyl]-4-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)pyridinium chloride,

- D. (1*RS*)-1-[4-(4-fluorophenyl)-4-oxobutyl]-4-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)-1,2,3,6-tetrahydropyridine 1-oxide,

- E. 1-[1-[4-[4-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-yl)-3,6-dihydropyridin-1(2*H*)-yl]-1-oxobutyl]phenyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one.

01/2005:2015
corrected**EBASTINE****Ebastinum** $C_{32}H_{39}NO_2$ M_r 469.7**DEFINITION**

1-[4-(1,1-Dimethylethyl)phenyl]-4-[4-(diphenylmethoxy)piperidin-1-yl]butan-1-one.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in methylene chloride, sparingly soluble in methanol.

mp: about 86 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of ebastine.

TESTS

Related substances. Liquid chromatography (2.2.29). *Keep the solutions protected from light.*

Solution A. Mix 65 volumes of *acetonitrile R* and 35 volumes of a 1.1 g/l solution of *phosphoric acid R* adjusted to pH 5.0 with a 40 g/l solution of *sodium hydroxide R*.

Test solution. Dissolve 0.125 g of the substance to be examined in solution A and dilute to 50.0 ml with the same solution.

Reference solution (a). Dissolve 5.0 mg of *ebastine impurity C CRS* and 5.0 mg of *ebastine impurity D CRS* in solution A and dilute to 20.0 ml with the same solution. Dilute 1.0 ml of the solution to 100.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with solution A. Dilute 1.0 ml of this solution to 10.0 ml with solution A.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* nitrile silica gel for chromatography R (5 μ m).

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of a 1.1 g/l solution of *phosphoric acid R* adjusted to pH 5.0 with a 40 g/l solution of *sodium hydroxide R*. Adjust the percentage of acetonitrile to between 30 per cent V/V and 40 per cent V/V so that the retention time of ebastine is about 110 min.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 μ l.

Run time: 1.4 times the retention time of ebastine.

Relative retention with reference to ebastine:

impurity A = about 0.04; impurity B = about 0.05; impurity D = about 0.20; impurity C = about 0.22; impurity F = about 0.42; impurity G = about 0.57; impurity E = about 1.14.

System suitability: reference solution (a):

- **resolution:** minimum 2.0 between the peaks due to impurity D and impurity C.

Limits:

- **impurities A, B, C, D, E, F, G:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphates (2.4.13): maximum 100 ppm.

Suspend 2.5 g in 25 ml of *dilute nitric acid R*. Boil under a reflux condenser for 10 min. Cool and filter. 15 ml of the filtrate complies with the limit test for sulphates.

Water (2.5.12): maximum 0.5 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 46.97 mg of $C_{32}H_{39}NO_2$.

STORAGE

Protected from light.

IMPURITIES

A. R1-H: diphenylmethanol (benzhydrol),

B. R2-CH₃: 1-[4-(1,1-dimethylethyl)phenyl]ethanone,

C. 4-(diphenylmethoxy)piperidine,

D. 1-[4-(1,1-dimethylethyl)phenyl]-4-(4-hydroxypiperidin-1-yl)butan-1-one,

- E. 1-[4-(1,1-dimethylpropyl)phenyl]-4-[4-(diphenylmethoxy)piperidin-1-yl]butan-1-one,

- F. 1-[4-(1,1-dimethylethyl)phenyl]-4-[cis-4-(diphenylmethoxy)-1-oxidopiperidin-1-yl]butan-1-one,

- G. 1-[4-(1,1-dimethylethyl)phenyl]-4-[trans-4-(diphenylmethoxy)-1-oxidopiperidin-1-yl]butan-1-one.

ECONAZOLE

Econazolum

$C_{18}H_{15}Cl_3N_2O$

M_r 381.7

DEFINITION

1-[(2*RS*)-2-[(4-Chlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in alcohol and in methylene chloride.

IDENTIFICATION

A. Melting point (2.2.14): 88 °C to 92 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of econazole.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *econazole* for system suitability CRS in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octadecylsilyl silica gel for chromatography R (3 μ m),
- temperature: 35 °C.

Mobile phase:

- mobile phase A: mix 20 volumes of *methanol R* and 80 volumes of a 0.77 g/l solution of ammonium acetate R,
- mobile phase B: *methanol R*, *acetonitrile R* (40:60 V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	60 → 10	40 → 90
25 - 27	10	90
27 - 28	10 → 60	90 → 40
28 - 33	60	40

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 10 μ l.

Relative retention with reference to econazole (retention time = about 15 min): impurity A = about 0.2; impurity B = about 0.6; impurity C = about 1.1.

System suitability: reference solution (a):

- **peak-to-valley ratio:** minimum 1.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to econazole.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity A by 1.4,
- **impurities A, B, C:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **total:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 75 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 38.17 mg of $C_{18}H_{15}Cl_3N_2O$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. (1RS)-1-(2,4-dichlorophenyl)-2-(1H-imidazol-1-yl)ethanol,

B. (2RS)-2-[(4-chlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethanamine,

EDETIC ACID

Acidum edeticum

 $C_{10}H_{16}N_2O_8$
 M_r 292.2

DEFINITION

(Ethylenedinitrilo)tetraacetic acid.

Content: 98.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs, after drying the substance to be examined in an oven at 100-105 °C for 2 h.

Comparison: *sodium edetate R*, treated as follows: dissolve 0.25 g of *sodium edetate R* in 5 ml of *water R*, add 1.0 ml of *dilute hydrochloric acid R*. Filter, wash the residue with 2 quantities, each of 5 ml, of *water R* and dry the residue in an oven at 100-105 °C for 2 h.

B. To 5 ml of *water R* add 0.1 ml of *ammonium thiocyanate solution R* and 0.1 ml of *ferric chloride solution R1* and mix. The solution is red. Add 0.5 ml of solution S (see Tests). The solution becomes yellowish.

C. To 10 ml of solution S add 0.5 ml of *calcium chloride solution R*. Make alkaline to *red litmus paper R* by the addition of *dilute ammonia R2* and add 3 ml of *ammonium oxalate solution R*. No precipitate is formed.

TESTS

Solution S. Dissolve 5.0 g in 20 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Impurity A. Liquid chromatography (2.2.29). Carry out the test protected from light.

Solvent mixture. Dissolve 10.0 g of *ferric sulphate pentahydrate R* in 20 ml of 0.5 M *sulphuric acid* and add 780 ml of *water R*. Adjust to pH 2.0 with 1 M *sodium hydroxide* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 0.100 g of the substance to be examined in 1.0 ml of 1 M *sodium hydroxide* and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dissolve 40.0 mg of *nitrilotriacetic acid R* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. To 1.0 ml of the solution add 0.1 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

- *size:* $l = 0.10$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* spherical *graphitised carbon for chromatography R1* (5 μ m) with a specific surface area of 120 m²/g and a pore size of 25 nm.

01/2005:2106

EDROPHONIUM CHLORIDE

Edrophonii chloridum

 $C_{10}H_{16}ClNO$ M_r 201.7

DEFINITION

N-Ethyl-3-hydroxy-*N,N*-dimethylanilinium chloride.*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.*Solubility*: very soluble in water, freely soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: edrophonium chloride CRS.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).Dissolve 0.5 g in *water R* and dilute to 25 ml with the same solvent.**pH** (2.2.3): 4.0 to 5.0.Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.**Related substances.** Liquid chromatography (2.2.29).*Test solution.* Dissolve 50.0 mg in *water R* and dilute to 50.0 ml with the same solvent.*Reference solution (a).* Dissolve 10.0 mg of 3-dimethylaminophenol *R* in *acetonitrile R* and dilute to 10.0 ml with the same solvent.*Reference solution (b).* Mix 1.0 ml of the test solution and 1.0 ml of reference solution (a) and dilute to 100.0 ml with *water R*. Dilute 10.0 ml of this solution to 100.0 ml with *water R*.*Column*:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: styrene-divinylbenzene copolymer *R* (8–10 μ m).

Mobile phase: mix 10 volumes of *acetonitrile R* and 90 volumes of a 7.7 g/l solution of tetramethylammonium bromide *R* previously adjusted to pH 3.0 with *phosphoric acid R*.*Flow rate*: 1 ml/min.*Detection*: spectrophotometer at 281 nm.*Injection*: 20 μ l.*Run time*: twice the retention time of edrophonium.*Relative retention* with reference to edrophonium (retention time = about 3.8 min): impurity A = about 1.3.*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to edrophonium and impurity A.

Mobile phase: dissolve 50.0 mg of ferric sulphate pentahydrate *R* in 50 ml of 0.5 *M* sulphuric acid and add 750 ml of *water R*. Adjust to pH 1.5 with 0.5 *M* sulphuric acid or 1 *M* sodium hydroxide, add 20 ml of ethylene glycol *R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.*Detection*: spectrophotometer at 273 nm.*Injection*: 20 μ l; filter the solutions and inject immediately.*Run time*: 4 times the retention time of the iron complex of impurity A.*Retention time*: iron complex of impurity A = about 5 min; iron complex of edetic acid = about 10 min.*System suitability*: reference solution:

- *resolution*: minimum 7 between the peaks due to the iron complex of impurity A and the iron complex of edetic acid,
- *signal-to-noise ratio*: minimum 50 for the peak due to impurity A.

Limit:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Chlorides (2.4.4): maximum 200 ppm.

To 10 ml of solution S add 8 ml of *nitric acid R* and stir for 10 min. A precipitate is formed. Filter and wash the filter with *water R*. Collect the filtrate and the washings and dilute to 20 ml with *water R*. Dilute 10 ml of this solution to 15 ml with *water R*.

Iron (2.4.9): maximum 80 ppm.

Dilute 2.5 ml of solution S to 10 ml with *water R* and add 0.25 g of *calcium chloride R* before adding the *thioglycollic acid R*. Allow to stand for 5 min. Also add 0.25 g of *calcium chloride R* to the standard.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Use a fused-silica crucible. If necessary moisten the residue on ignition with *nitric acid R* and ignite until a white residue is obtained. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 2.0 ml of *dilute sodium hydroxide solution R* and dilute to 300 ml with *water R*. Add 2 g of *hexamethylenetetramine R* and 2 ml of *dilute hydrochloric acid R*. Titrate with 0.1 *M* *zinc sulphate* using about 50 mg of *xylene orange triturate R* as indicator.

1 ml of 0.1 *M* *zinc sulphate* corresponds to 29.22 mg of $C_{10}H_{16}N_2O_8$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

A. nitritotriacetic acid.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** for each impurity, not more than the area of the peak due to edrophonium in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 5 times the area of the peak due to edrophonium in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the peak due to edrophonium in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 8.3 IU/mg.

ASSAY

Dissolve 0.150 g in 60 ml of a mixture of equal volumes of *acetic anhydride R* and *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.17 mg of $C_{10}H_{16}ClNO$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

A. 3-(dimethylamino)phenol.

01/2005:1217

ELDER FLOWER**Sambuci flos****DEFINITION**

Elder flower consists of the dried flowers of *Sambucus nigra* L. It contains not less than 0.80 per cent of flavonoids, calculated as isoquercitroside ($C_{21}H_{20}O_{12}$; M_r 464.4) with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The flower, about 5 mm in diameter, has three small bracts (hand lens) and may have a peduncle. The five-toothed calyx is small; the corolla is light yellow, with five broadly oval petals fused at their bases into a tube. The filaments of the five yellow stamens alternate with the petals. The corolla is often isolated or attached to the stamens, to which it is fused at the base. The ovary is inferior with three locules and it bears a short style with three obtuse stigmata.

- B. Reduce to a powder (355). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous spherical, sometimes ellipsoidal, pollen grains about 30 µm in diameter, with three germinal pores and very finely pitted exine; calyx epidermal cells with a striated cuticle and occasional unicellular marginal teeth from the basal region; corolla fragments with numerous small globules of volatile oil, those of the upper epidermis with slightly thickened and beaded walls and a striated cuticle; mesophyll cells of petals and sepals with idioblasts containing numerous sandy crystals of calcium oxalate.
- C. Examine in ultraviolet light at 365 nm the chromatograms obtained in the test for *Sambucus ebulus*. The chromatogram obtained with the test solution shows an intense zone of light blue fluorescence due to chlorogenic acid, a zone of orange fluorescence due to rutin as well as a zone of orange fluorescence due to isoquercitrin, which appears slightly above the zone due to hyperoside in the chromatogram obtained with the reference solution. A zone of greenish-blue fluorescence appears in the chromatogram obtained with the test solution a little below the caffeic acid zone in the chromatogram obtained with the reference solution. Additional faint fluorescent zones may be present. In daylight, only the orange fluorescent zones due to rutin and isoquercitroside in the chromatogram obtained with the test solution are clearly visible.

TESTS

Foreign matter (2.8.2). Determined on 10 g, not more than 8 per cent of fragments of coarse pedicels and other foreign matter; not more than 15 per cent of discoloured, brown flowers.

Sambucus ebulus L. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.5 g of the powdered drug (355) add 10 ml of *methanol R* and heat in a water bath at 65 °C for 5 min, shaking frequently. Allow to cool and filter. Dilute the filtrate to 10 ml with *methanol R*.

Reference solution. Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply separately to the plate, as bands, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R*, 30 volumes of *methyl ethyl ketone R* and 50 volumes of *ethyl acetate R*. Dry the plate at 100-105 °C and spray it while still warm with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower half, with increasing R_f values, the zone of orange fluorescence due to rutin, the zone of light blue fluorescence due to chlorogenic acid and the zone of orange-yellow to orange-brown fluorescence due to hyperoside. The upper third presents a zone of greenish-blue fluorescence due to caffeic acid. The chromatogram obtained with the test solution does not show a pink zone below the zone due to rutin in the chromatogram obtained with the reference solution.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, introduce 0.600 g of the powdered drug (355), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with two quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a paper-filter into a volumetric flask, dilute to 100.0 ml with *acetone R* by rinsing the flask and the paper-filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with one quantity of 15 ml and then three quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with two quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Compensation solution. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation solution at 425 nm. Calculate the percentage content of flavonoids, calculated as isoquercitroside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500.

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light.

corrected

ELEUTHEROCOCCUS

Eleutherococci radix

DEFINITION

Dried, whole or cut underground organs of *Eleutherococcus senticosus* (Rupr. et Maxim.) Maxim.

Content: minimum 0.08 per cent for the sum of eleutheroside B (*M_r* 372.4) and eleutheroside E (*M_r* 742.7).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The rhizome is knotty, of irregular cylindrical shape, 1.5 cm to 4.0 cm in diameter; the surface is rugged, longitudinally wrinkled and greyish-brown to blackish-brown; the bark, about 2 mm thick, closely adheres to the xylem; the heartwood is light brown and the sapwood is pale yellow; the fracture shows short thin

fibres in the bark and is coarsely fibrous, especially in the internal part of the xylem. The lower surface bears numerous cylindrical and knotty roots, 3.5 cm to 15 cm long and 0.3 cm to 1.5 cm in diameter; with a smooth, greyish-brown to blackish-brown surface; the bark is about 0.5 mm thick, closely adhering to the pale yellow xylem; the fracture is slightly fibrous; in places where the outer layer has been removed, the outer surface is yellowish-brown.

- B. Reduce to a powder (355). The powder is yellowish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows numerous groups of thick-walled, lignified fibres; fragments of reticulate and bordered pitted vessels with a wide lumen; groups of secretory canals, up to 20 µm in diameter with brown contents; parenchymatous cells containing cluster crystals of calcium oxalate 10 µm to 50 µm in diameter. Examine under a microscope, using a 50 per cent V/V solution of *glycerol R*. The powder shows small starch granules, rounded to slightly angular in outline, single compounds or with 2 or 3 components.
- C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *alcohol (50 per cent V/V) R* and boil under reflux for 1 h. Cool and filter. Evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2.5 ml of a mixture of 5 volumes of *water R* and 20 volumes of *alcohol (50 per cent V/V) R* and filter.

Reference solution. Dissolve 2.0 mg of *esculin R* and 2.0 mg of *catalpol R* in 20 ml of a mixture of 2 volumes of *water R* and 8 volumes of *alcohol (50 per cent V/V) R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *water R*, *methanol R*, *methylene chloride R* (4:30:70 V/V/V).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: the chromatogram obtained with the reference solution shows in the upper half a blue fluorescent zone (esculin).

Detection B: spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Esculin: a blue fluorescent zone (marked at 365 nm) Catalpol: a violet-brown zone	A brown zone (eleutheroside B)
	A reddish-brown zone (eleutheroside E)
	2 brown zones
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3 per cent.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 8.0 per cent.

ASSAY

Liquid chromatography (2.2.29).

Reference solution (a). Dissolve 10 mg of *ferulic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *caffeic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (c). Transfer 1 ml of reference solution (a) to a 25 ml volumetric flask and dilute to 25.0 ml with a mixture of equal volumes of *methanol R* and *water R*. Filter through a nylon filter (pore size 0.45 µm).

Reference solution (d). Transfer 1 ml of reference solution (a) and 1 ml of reference solution (b) in a mixture of equal volumes of *methanol R* and *water R* and dilute to 25.0 ml with the same mixture of solvents. Filter through a nylon filter (pore size 0.45 µm).

Figure 1419.-1. – UV spectrum of eleutheroside B for the assay of eleutherococcus

Test solution. To 0.500 g of the powdered drug (355) in a 100 ml round-bottomed flask, add 30 ml of a mixture of equal volumes of *alcohol R* and *water R*. Heat in a water-bath at 60 °C for 30 min. Allow to cool and filter through a sintered-glass filter. Collect the liquid in a 250 ml round-bottomed flask. Repeat this operation twice, using the residue obtained in the filtration step instead of the powdered drug. Add both fractions of supernatant liquid to the 250 ml round-bottomed flask. Evaporate under reduced pressure until about 10 ml of supernatant liquid is left in the flask. Transfer the supernatant liquid quantitatively to a 20.0 ml volumetric flask and dilute to 20.0 ml with a mixture of equal volumes of *alcohol R* and *water R*. Filter through a nylon filter (pore size 0.45 µm).

Figure 1419.-2. – UV spectrum of eleutheroside E for the assay of eleutherococcus

Precolumn:

- size: $l = 0.04$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase:

- mobile phase A: phosphoric acid R, water R (0.5:99.5 V/V),
- mobile phase B: acetonitrile for chromatography R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	90	10
5 - 27	90 $\rightarrow$ 80	10 $\rightarrow$ 20
27 - 30	80 $\rightarrow$ 50	20 $\rightarrow$ 50
30 - 35	50	50
35 - 40	50 $\rightarrow$ 90	50 $\rightarrow$ 10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 μ l of the test solution and reference solutions (c) and (d).

Retention time: eleutheroside B = about 10 min; eleutheroside E = about 22 min.

Locate the peaks due to eleutheroside B and eleutheroside E using the UV spectra shown in Figures 1419-1 and 1419-2.

System suitability: reference solution (d):

- resolution: minimum 15 between the peaks due to caffeic acid and ferulic acid.

Calculate the total percentage content of eleutheroside B and eleutheroside E from the expression:

$$\frac{(A_B \times C \times 0.73 \times 2)}{(A_R \times m)} + \frac{(A_E \times C \times 1.90 \times 2)}{(A_R \times m)}$$

- A_B = area of the peak due to eleutheroside B in the chromatogram obtained with the test solution,
- A_E = area of the peak due to eleutheroside E in the chromatogram obtained with the test solution,
- A_R = area of the peak due to ferulic acid in the chromatogram obtained with reference solution (c),
- C = concentration of ferulic acid in reference solution (c), in micrograms per millilitre,
- m = mass of the drug to be examined, in milligrams.

01/2005:0080

EMETINE HYDROCHLORIDE HEPTAHYDRATE

Emetini hydrochloridum heptahydricum

$C_{29}H_{42}Cl_2N_2O_4 \cdot 7H_2O$

M_r 680

DEFINITION

Emetine hydrochloride heptahydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2S,3R,11bS)-2-[[[(1R)-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinolin-1-yl]methyl]-3-ethyl-9,10-dimethoxy-1,3,4,6,7,11b-hexahydro-2H-benzo[a]quinolizine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, freely soluble in water and in alcohol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with emetine hydrochloride CRS.
- Examine the chromatograms obtained in the test for related substances in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the spot in the chromatogram obtained with reference solution (a).
- Dissolve about 10 mg in 2 ml of dilute hydrogen peroxide solution R, add 1 ml of hydrochloric acid R and heat. An orange colour develops.
- Sprinkle about 5 mg on the surface of 1 ml of sulphomolybdic reagent R2. A bright-green colour develops.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in carbon dioxide-free water R and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ or BY₅ (2.2.2, Method II).

pH (2.2.3). Dilute 4 ml of solution S to 10 ml with carbon dioxide-free water R. The pH of the solution is 4.0 to 6.0.

Specific optical rotation (2.2.7). Dissolve in water R a quantity of the substance to be examined corresponding to 1.250 g of dried substance and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 16 to + 19, calculated with reference to the dried substance.

01/2005:0081

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*. Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *emetine hydrochloride CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *isoemetine hydrobromide CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 50 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (c). Dissolve 10 mg of *cephaeline hydrochloride CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 50 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (d). Dilute 1 ml of reference solution (a) to 100 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (e). To 1 ml of reference solution (a) add 1 ml of reference solution (b) and 1 ml of reference solution (c).

Apply to the plate 10 µl of the test solution and each of reference solutions (a), (b), (c) and (d) and 30 µl of reference solution (e). Develop over a path of 15 cm using a mixture of 0.5 volumes of *diethylamine R*, 2 volumes of *water R*, 5 volumes of *methanol R*, 20 volumes of *ethylene glycol monomethyl ether R* and 100 volumes of *chloroform R*. Allow the plate to dry in air until the solvent has evaporated. Spray in a well ventilated fume-cupboard with *chloroformic solution of iodine R* and heat at 60 °C for 15 min. Examine in ultraviolet light at 365 nm. In the chromatogram obtained with the test solution, any spots corresponding to isoemetine and cephaeline are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively (2.0 per cent); any spot, apart from the principal spot and the spots corresponding to isoemetine and cephaeline, is not more intense than the spot in the chromatogram obtained with reference solution (d) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows three clearly separated spots.

Loss on drying (2.2.32). 15.0 per cent to 19.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.68 mg of $C_{29}H_{42}Cl_2N_2O_4 \cdot 5H_2O$.

STORAGE

Store protected from light.

EMETINE HYDROCHLORIDE PENTAHYDRATE

Emetini hydrochloridum pentahydricum

$C_{29}H_{42}Cl_2N_2O_4 \cdot 5H_2O$

M_r 644

DEFINITION

Emetine hydrochloride pentahydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*S*,3*R*,11*bS*)-2-[[*(1R*)-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinolin-1-yl]methyl]-3-ethyl-9,10-dimethoxy-1,3,4,6,7,11*b*-hexahydro-2*H*-benzo[*a*]quinolizine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, freely soluble in water and in alcohol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *emetine hydrochloride CRS*.
- Examine the chromatograms obtained in the test for related substances in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the spot in the chromatogram obtained with reference solution (a).
- Dissolve about 10 mg in 2 ml of *dilute hydrogen peroxide solution R*, add 1 ml of *hydrochloric acid R* and heat. An orange colour develops.
- Sprinkle about 5 mg on the surface of 1 ml of *sulphomolybdic reagent R2*. A bright-green colour develops.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_5 or BY_5 (2.2.2, *Method II*).

pH (2.2.3). Dilute 4 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 4.0 to 6.0.

Specific optical rotation (2.2.7). Dissolve in *water R* a quantity of the substance to be examined corresponding to 1.250 g of dried substance and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 16 to + 19, calculated with reference to the dried substance.

01/2005:1420

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*. Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *emetine hydrochloride CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *isoemetine hydrobromide CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 50 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (c). Dissolve 10 mg of *cephaeline hydrochloride CRS* in *methanol R* containing 1 per cent V/V of *dilute ammonia R2* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 50 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (d). Dilute 1 ml of reference solution (a) to 100 ml with *methanol R* containing 1 per cent V/V of *dilute ammonia R2*.

Reference solution (e). To 1 ml of reference solution (a) add 1 ml of reference solution (b) and 1 ml of reference solution (c).

Apply to the plate 10 µl of the test solution and each of reference solutions (a), (b), (c) and (d) and 30 µl of reference solution (e). Develop over a path of 15 cm using a mixture of 0.5 volumes of *diethylamine R*, 2 volumes of *water R*, 5 volumes of *methanol R*, 20 volumes of *ethylene glycol monomethyl ether R* and 100 volumes of *chloroform R*. Allow the plate to dry in air until the solvent has evaporated. Spray in a well ventilated fume-cupboard with *chloroformic solution of iodine R* and heat at 60 °C for 15 min. Examine in ultraviolet light at 365 nm. In the chromatogram obtained with the test solution, any spots corresponding to isoemetine and cephaeline are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively (2.0 per cent); any spot, apart from the principal spot and the spots corresponding to isoemetine and cephaeline, is not more intense than the spot in the chromatogram obtained with reference solution (d) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows three clearly separated spots.

Loss on drying (2.2.32). 11.0 per cent to 15.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.68 mg of $C_{29}H_{42}Cl_2N_2O_4$.

STORAGE

Store protected from light.

ENALAPRIL MALEATE

Enalaprili maleas

 $C_{24}H_{32}N_2O_9$
 M_r 492.5

DEFINITION

Enalapril maleate contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (2S)-1-[(2S)-2-[(1S)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]pyrrolidine-2-carboxylic acid (Z)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder, sparingly soluble in water, freely soluble in methanol, practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Melting point (2.2.14): 143 °C to 145 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *enalapril maleate CRS*.
- Dissolve about 30 mg in 3 ml of *water R*. Add 1 ml of *bromine water R* and heat on a water bath until bromine has disappeared completely and cool. To 0.2 ml of this solution, add 3 ml of a 3 g/l solution of *resorcinol R* in *sulphuric acid R* and heat on a water bath for 15 min. A reddish-brown colour develops.
- To about 30 mg, add 0.5 ml of a 100 g/l solution of *hydroxylamine hydrochloride R* in *methanol R* and 1.0 ml of a 100 g/l solution of *potassium hydroxide R* in *alcohol R*. Heat to boiling, allow to cool and acidify with *dilute hydrochloric acid R*. Add 0.2 ml of *ferric chloride solution R1* diluted 1 to 10; a reddish-brown colour appears.

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 2.4 to 2.9.

Specific optical rotation (2.2.7): −48 to −51, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Buffer solution A. Dissolve 2.8 g of *sodium dihydrogen phosphate monohydrate R* in 950 ml of *water R*. Adjust to pH 2.5 with *phosphoric acid R* and dilute to 1000 ml with *water R*.

Buffer solution B. Dissolve 2.8 g of *sodium dihydrogen phosphate monohydrate R* in 950 ml of *water R*. Adjust to pH 6.8 with *strong sodium hydroxide solution R* and dilute to 1000 ml with *water R*.

Dissolution mixture. Mix 50 ml of *acetonitrile R1* and 950 ml of buffer solution A.

Test solution. Dissolve 30.0 mg of the substance to be examined in the dissolution mixture and dilute to 100.0 ml with the same mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the dissolution mixture.

Reference solution (b). Dissolve 3.0 mg of *enalapril for system suitability CRS* in the dissolution mixture and dilute to 10.0 ml with the same mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.1 mm in internal diameter packed with *styrene-divinylbenzene copolymer R* (5 µm),

- as mobile phase at a flow rate of 1.4 ml/min,

Mobile phase A. Mix 50 ml of *acetonitrile R1* and 950 ml of buffer solution B,

Mobile phase B. Mix 340 ml of buffer solution B and 660 ml of *acetonitrile R1*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	95 → 40	5 → 60
20 - 25	40	60
25 - 26	40 → 95	60 → 5
26 - 30	95	5

- as detector a spectrophotometer set at 215 nm, maintaining the temperature of the column at 70 °C.

Inject 50 µl of reference solution (b). When the chromatogram is recorded in the prescribed conditions, the retention times are: enalapril about 11 min and impurity A about 12 min. The test is not valid unless the resolution between the peaks corresponding to enalapril and impurity A is at least 1.5. Inject 50 µl of the test solution and 50 µl of reference solution (a). In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity A is not greater than that of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); the area of any peak apart from the principal peak and any peak corresponding to impurity A, is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of any such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 2.0 g complies with limit test C (10 ppm). Use 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent determined on 1.000 g by heating in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *carbon dioxide-free water R* and dilute to 30 ml with the same solvent. Titrate with 0.1 M *sodium hydroxide* determining the end point potentiometrically (2.2.20). Titrate to the second point of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 16.42 mg of C₂₄H₃₂N₂O₉.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, H.

Other detectable impurities: F, G, I.

A. (2S)-1-[(2S)-2-[(1R)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]pyrrolidine-2-carboxylic acid,

B. (2S)-2-[(1S)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoic acid,

C. R = H: (2S)-1-[(2S)-2-[(1S)-1-carboxy-3-phenylpropyl]amino]propanoyl]pyrrolidine-2-carboxylic acid,

E. R = CH₂-CH₂-C₆H₅: (2S)-1-[(2S)-2-[(1S)-3-phenyl-1-[(2-phenylethoxy)carbonyl]propyl]amino]propanoyl]pyrrolidine-2-carboxylic acid,

F. R = C₄H₉: (2S)-1-[(2S)-2-[(1S)-1-(butoxycarbonyl)-3-phenylpropyl]amino]propanoyl]pyrrolidine-2-carboxylic acid,

D. ethyl (2S)-2-[(3S,8aS)-3-methyl-1,4-dioxooctahydropyrrolo[1,2-a]pyrazin-2-yl]-4-phenylbutanoate,

G. (2S)-2-[(1S)-3-cyclohexyl-1-(ethoxycarbonyl)propyl]amino]propanoic acid,

H. (2*S*)-1-[(2*S*)-2-[[[(1*S*)-3-cyclohexyl-1-(ethoxycarbonyl)propyl]amino]propanoyl]pyrrolidine-2-carboxylic acid,

I. 1*H*-imidazole.

ENILCONAZOLE FOR VETERINARY USE

Enilconazolum ad usum veterinarium

$C_{14}H_{14}Cl_2N_2O$

M_r 297.2

DEFINITION

1-[(2*RS*)-2-(2,4-Dichlorophenyl)-2-(prop-2-enyloxy)ethyl]-1*H*-imidazole.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: clear, yellowish, oily liquid or solid mass.

Solubility: very slightly soluble in water, freely soluble in alcohol, in methanol and in toluene.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: enilconazole CRS.

TESTS

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$.

Dissolve 0.1 g in *methanol R* and dilute to 10 ml with the same solvent.

Related substances. Gas chromatography (2.2.28). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.100 g of the substance to be examined in *toluene R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of enilconazole CRS and 10.0 mg of enilconazole impurity E CRS in *toluene R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *toluene R*. Dilute 1.0 ml of this solution to 10.0 ml with *toluene R*.

Column:

- *material*: fused silica,
- *size*: $l = 25$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: chemically bonded poly(dimethyl)(diphenyl)siloxane R (film thickness 0.52 μ m).

Carrier gas: helium for chromatography R.

Flow rate: 1.3 ml/min.

Split ratio: 1:38.

Temperature:

	Time (min)	Temperature ($^\circ$ C)
Column	0 - 6.4 6.4 - 14	100 $\rightarrow$ 260 260
Injection port	-	250
Detector	-	300

Detection: flame ionisation.

Injection: 2 μ l.

Relative retentions with reference to enilconazole (retention time = about 10 min): impurity A = about 0.6; impurity B = about 0.7; impurity C = about 0.8; impurity D = about 0.9; impurity F = about 1.1.

System suitability: reference solution (a):

- *resolution*: minimum 2.5 between the peaks due to enilconazole and impurity E.

Limits:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 40 $^\circ$ C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.230 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 *M perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 *M perchloric acid* is equivalent to 29.72 mg of $C_{14}H_{14}Cl_2N_2O$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. $R_1 = R_2 = H$: (2*RS*)-2-(2,4-dichlorophenyl)-2-(prop-2-en-1-yloxy)ethanamine,
 B. $R_1 = H$, $R_2 = CH_2CH=CH_2$: *N*-(2*RS*)-2-(2,4-dichlorophenyl)-2-(prop-2-en-1-yloxy)ethylprop-2-en-1-amine,
 C. $R_1 = CHO$, $R_2 = H$: *N*-(2*RS*)-2-(2,4-dichlorophenyl)-2-(prop-2-en-1-yloxy)ethylformamide,
 D. $R_1 = CHO$, $R_2 = CH_2CH=CH_2$: *N*-(2*RS*)-2-(2,4-dichlorophenyl)-2-(prop-2-en-1-yloxy)ethyl-*N*-(prop-2-en-1-yl)formamide,

- E. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,

- F. 1-[(2*RS*)-2-(3,4-dichlorophenyl)-2-(prop-2-en-1-yloxy)ethyl]-1*H*-imidazole.

01/2005:1097

ENOXAPARIN SODIUM

Enoxaparinum natricum

DEFINITION

Enoxaparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by alkaline depolymerisation of the benzyl ester derivative of heparin from porcine intestinal mucosa. The majority of the components have a 4-enopyranose uronate structure at the non-reducing end of their chain.

Enoxaparin sodium complies with the monograph on Heparins, low-molecular-mass (0828) with the modifications and additional requirements below.

The mass-average molecular mass ranges between 3500 and 5500 with a characteristic value of about 4500.

The degree of sulphatation is about 2 per disaccharide unit.

The potency is not less than 90 IU and not more than 125 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 3.3 and 5.3.

IDENTIFICATION

Carry out identification test C as described in the monograph on *Heparins, low-molecular-mass (0828)*. The following requirements apply.

The mass-average molecular mass ranges between 3500 and 5500. The mass percentage of chains lower than 2000 ranges between 12.0 per cent and 20.0 per cent. The mass percentage of chains between 2000 and 8000 ranges between 68.0 per cent and 88.0 per cent.

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Absorbance (2.2.25). Dissolve 50.0 mg in 100 ml of 0.01 *M hydrochloric acid*. The specific absorbance at 231 nm is 14.0 to 20.0, calculated with reference to the dried substance.

Benzyl alcohol. Not more than 0.1 per cent *m/m*, determined by liquid chromatography (2.2.29).

Internal standard solution. Prepare a 1 g/l solution of 3,4-dimethylphenol *R* in *methanol R*.

Test solution. Dissolve about 0.500 g of the substance to be examined in 5.0 ml of 1 *M sodium hydroxide*. Allow to stand for 1 h. Add 1.0 ml of *glacial acetic acid R* and 1.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

Reference solution. Prepare a 0.25 g/l solution of *benzyl alcohol R* in *water R*. Mix 0.50 ml of this solution with 1.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m) equipped with a guard column 20 mm long and 4.6 mm in internal diameter, packed with the same material,
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *methanol R*, 15 volumes of *acetonitrile R* and 80 volumes of *water R*,
- as detector a spectrophotometer set at 256 nm.

From the chromatogram obtained with the reference solution, calculate the ratio (R_1) of the height of the peak due to benzyl alcohol to the height of the peak due to the internal standard. From the chromatogram obtained with the test solution, calculate the ratio (R_2) of the height of the peak due to benzyl alcohol to the height of the peak due to the internal standard.

Calculate the content (*m/m*) of benzyl alcohol from the following expression:

$$\frac{0.0125 \times R_2}{m \times R_1}$$

m = mass of the substance to be examined in grams.

Sodium. 11.3 to 13.5 per cent of Na calculated with reference to the dried substance and determined by atomic absorption spectrometry (2.2.23, *Method I*).

01/2005:1511

ENOXOLONE

Enoxolonum

C₃₀H₄₆O₄*M_r* 470.7

DEFINITION

(20β)-3β-Hydroxy-11-oxo-olean-12-en-29-oic acid.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: practically insoluble in water, soluble in ethanol, sparingly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (2.2.24).

Comparison: enoxolone CRS.

If the spectra obtained in the solid state show differences, dissolve 0.2 g of the substance to be examined and 0.2 g of the reference substance separately in 6 ml of *ethanol R*. Boil under a reflux condenser for 1 h and add 6 ml of *water R*. A precipitate is formed. Cool to about 10 °C and filter with the aid of vacuum. Wash the precipitate with 10 ml of *alcohol R*, dry in an oven at 80 °C and record new spectra.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *enoxolone CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: glacial acetic acid *R*, acetone *R*, methylene chloride *R* (5:10:90 V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air for 5 min.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 50 mg in 10 ml of *methylene chloride R*. To 2 ml of this solution, add 1 ml of *acetic anhydride R* and 0.3 ml of *sulphuric acid R*. A pink colour is produced.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Dissolve 0.1 g in *ethanol R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): + 145 to + 154 (dried substance).

Dissolve 0.50 g in *dioxan R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 0.1 g of *18α-glycyrrhetinic acid R* in *tetrahydrofuran R* and dilute to 100.0 ml with the same solvent. To 2.0 ml of the solution, add 2.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Column:

- **size:** *l* = 0.25 m, Ø = 4.6 mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm),
- **temperature:** 30 °C.

Mobile phase: mix 430 volumes of *tetrahydrofuran R* and 570 volumes of a 1.36 g/l solution of *sodium acetate R* adjusted to pH 4.8 with *glacial acetic acid R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 20 µl loop injector; inject the test solution and the reference solutions.

Run time: 4 times the retention time of enoxolone.

System suitability:

- **resolution:** minimum of 2.0 between the peaks due to enoxolone and to *18α-glycyrrhetinic acid* in the chromatogram obtained with reference solution (c).

Limits:

- **any impurity:** not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.330 g in 40 ml of *dimethylformamide R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 47.07 mg of $C_{30}H_{46}O_4$.

STORAGE

Protected from light.

IMPURITIES

A. (20β)-3β-hydroxy-11-oxo-18α-olean-12-en-29-oic acid,

B. (4β,20β)-3β,23-dihydroxy-11-oxo-olean-12-en-29-oic acid.

01/2005:0488

EPHEDRINE, ANHYDROUS

Ephedrinum anhydricum

$C_{10}H_{15}NO$

M_r 165.2

DEFINITION

Anhydrous ephedrine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (1*R*,2*S*)-2-methylamino-1-phenylpropan-1-ol, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, soluble in water, very soluble in alcohol.

It melts at about 36 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with the base isolated from *ephedrine hydrochloride CRS*. Examine the substances in discs prepared as follows: dissolve 40 mg of the substance to be examined in 1 ml of *water R*, add 1 ml of *dilute sodium hydroxide solution R* and 4 ml of *chloroform R* and shake; dry the organic layer over 0.2 g of *anhydrous sodium sulphate R*; prepare a blank disc using about 0.3 g of *potassium bromide R*; apply dropwise to the disc 0.1 ml of the organic layer, allowing the solvent to evaporate between applications; dry the disc at 50 °C for 2 min. Repeat the operations using 50 mg of *ephedrine hydrochloride CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 10 mg in 1 ml of *water R*. Add 0.2 ml of *strong sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. A violet colour is produced. Add 2 ml of *ether R* and shake. The ether layer is purple and the aqueous layer blue.
- It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 0.25 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 2.25 g in 15 ml of *dilute hydrochloric acid R* and dilute to 50.0 ml with *water R*. The specific optical rotation is –41 to –43, calculated with reference to the anhydrous substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 25 mg of *ephedrine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 200 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *chloroform R*, 15 volumes of *concentrated ammonia R* and 80 volumes of *2-propanol R*. Allow the plate to dry in air and spray with *ninhydrin solution R*. Heat at 110 °C for 5 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any spot of lighter colour than the background.

Chlorides. Dissolve 0.17 g in 10 ml of *water R*. Add 5 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R1*. Allow to stand for 2 min, protected from bright light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time and in the same

manner using 10 ml of *chloride standard solution* (5 ppm *Cl*) *R*, 5 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R1* (290 ppm).

Water (2.5.12). Not more than 0.5 per cent, determined on 2.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 5 ml of *alcohol R* and add 20.0 ml of 0.1 *M hydrochloric acid*. Using 0.05 ml of *methyl red solution R* as indicator, titrate with 0.1 *M sodium hydroxide* until a yellow colour is obtained.

1 ml of 0.1 *M hydrochloric acid* is equivalent to 16.52 mg of $C_{10}H_{15}NO$.

STORAGE

Store protected from light.

01/2005:0489

EPHEDRINE HEMIHYDRATE

Ephedrinum hemihydricum

$C_{10}H_{15}NO \cdot \frac{1}{2}H_2O$

M_r 174.2

DEFINITION

Ephedrine hemihydrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (1*R*,2*S*)-2-(methylamino)-1-phenylpropan-1-ol, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, soluble in water, very soluble in alcohol.

It melts at about 42 °C, determined without previous drying.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with the base isolated from *ephedrine hydrochloride CRS*. Examine the substances in discs prepared as follows: dissolve 40 mg of the substance to be examined in 1 ml of *water R*, add 1 ml of *dilute sodium hydroxide solution R* and 4 ml of *chloroform R* and shake; dry the organic layer over 0.2 g of *anhydrous sodium sulphate R*; prepare a blank disc using about 0.3 g of *potassium bromide R*; apply dropwise to the disc 0.1 ml of the organic layer, allowing the solvent to evaporate between applications; dry the disc at 50 °C for 2 min. Repeat the operations using 50 mg of *ephedrine hydrochloride CRS*.

- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 10 mg in 1 ml of *water R*. Add 0.2 ml of *strong sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. A violet colour is produced. Add 2 ml of *ether R* and shake. The ether layer is purple and the aqueous layer blue.
- E. It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 0.25 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 2.25 g in 15 ml of *dilute hydrochloric acid R* and dilute to 50.0 ml with *water R*. The specific optical rotation is –41 to –43, calculated with reference to the anhydrous substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 25 mg of *ephedrine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 200 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *chloroform R*, 15 volumes of *concentrated ammonia R* and 80 volumes of *2-propanol R*. Allow the plate to dry in air and spray with *ninhydrin solution R*. Heat at 110 °C for 5 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any spot of lighter colour than the background.

Chlorides. Dissolve 0.18 g in 10 ml of *water R*. Add 5 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R1*. Allow to stand for 2 min, protected from bright light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of *chloride standard solution* (5 ppm *Cl*) *R*, 5 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R1* (280 ppm).

Water (2.5.12): 4.5 per cent to 5.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 5 ml of *alcohol R* and add 20.0 ml of 0.1 *M hydrochloric acid*. Using 0.05 ml of *methyl red solution R* as indicator, titrate with 0.1 *M sodium hydroxide* until a yellow colour is obtained.

1 ml of 0.1 *M hydrochloric acid* is equivalent to 16.52 mg of $C_{10}H_{15}NO$.

STORAGE

Store protected from light.

Protected from light.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B.

A. (–)-(1R)-1-hydroxy-1-phenylpropan-2-one,

B. pseudoephedrine.

01/2005:0715

EPHEDRINE HYDROCHLORIDE,
RACEMIC

Ephedrini racemici hydrochloridum

 $C_{10}H_{16}ClNO$ M_r 201.7

DEFINITION

Racemic ephedrine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (1R,2S)-2-(methylamino)-1-phenylpropan-1-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, soluble in alcohol.

It melts at about 188 °C.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- It complies with the test for angle of optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *racemic ephedrine hydrochloride CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 0.1 ml of solution S (see Tests) add 1 ml of *water R*, 0.2 ml of *copper sulphate solution R* and 1 ml of *strong sodium hydroxide solution R*. A violet colour is produced. Add 2 ml of *ether R* and shake. The ether layer is purple and the aqueous layer is blue.
- To 5 ml of solution S add 5 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.00 g in *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.1 ml of 0.01 M *sodium hydroxide*; the solution is yellow. Add 0.2 ml of 0.01 M *hydrochloric acid*; the solution is red.

Angle of optical rotation (2.2.7): + 0.2° to – 0.2°, determined on solution S.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *racemic ephedrine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 200 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *chloroform R*, 15 volumes of *concentrated ammonia R* and 80 volumes of *2-propanol R*. Allow the plate to dry in air. Spray with *ninhydrin solution R* and heat at 110 °C for 5 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any spot of lighter colour than the background.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g in 30 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* corresponds to 20.17 mg of $C_{10}H_{16}ClNO$.

STORAGE

Store protected from light.

01/2005:1590

EPIRUBICIN HYDROCHLORIDE

Epirubicini hydrochloridum

 $C_{27}H_{30}ClNO_{11}$ M_r 580.0

DEFINITION

(8S,10S)-10-[(3-Amino-2,3,6-trideoxy- α -L-arabino-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione hydrochloride.

Substance obtained by chemical transformation of a substance produced by certain strains of *Streptomyces peuceii*us.

Content: 97.0 per cent to 102.0 per cent (anhydrous and acetone-free substance).

CHARACTERS

Appearance: orange-red powder.

Solubility: soluble in water and in methanol, slightly soluble in anhydrous ethanol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *epirubicin hydrochloride CRS*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 0.5 ml of *nitric acid R*, add 0.5 ml of *water R* and heat over a flame for 2 min. Allow to cool and add 0.5 ml of *silver nitrate solution R1*. A white precipitate is formed.

TESTS

pH (2.2.3): 4.0 to 5.5.

Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *epirubicin hydrochloride CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *epirubicin hydrochloride CRS* and 10 mg of *doxorubicin hydrochloride CRS* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *doxorubicin hydrochloride CRS* in a mixture of 5 ml of *water R* and 5 ml of *phosphoric acid R*. Allow to stand for 30 min. Adjust to pH 2.6 with an 80 g/l solution of *sodium hydroxide R*. Add 15 ml of *acetonitrile R* and 10 ml of *methanol R*. Mix.

Reference solution (d). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** trimethylsilyl silica gel for chromatography *R* (6 μ m),
- **temperature:** 35 °C.

Mobile phase: mix 17 volumes of *methanol R*, 29 volumes of *acetonitrile R* and 54 volumes of a solution containing 3.7 g/l of *sodium laurilsulfate R* and 2.8 per cent V/V of *dilute phosphoric acid R*.

Flow rate: 2.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 μ l of the test solution and reference solutions (b), (c) and (d).

Run time: 3.5 times the retention time of epirubicin.

Identification of impurities: use the 2nd most abundant peak present in the chromatogram obtained with reference solution (c) to identify impurity A.

Relative retention with reference to epirubicin (retention time = about 9.5 min): impurity A = about 0.3; impurity B = about 0.4; impurity C = about 0.8; impurity E = about 1.1; impurity D = about 1.5; impurity F = about 1.7; impurity G = about 2.1.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to impurity C and epirubicin.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity A by 0.7,
- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent),
- **any other impurity:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (2.0 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Acetone (2.4.24): maximum 1.5 per cent.

Water (2.5.12): maximum 4.0 per cent, determined on 0.100 g.

Bacterial endotoxins (2.6.14): less than 1.1 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{27}H_{30}ClNO_{11}$.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. R = OH: (8*S*,10*S*)-6,8,10,11-tetrahydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicinone),

B. R = H: (8*S*,10*S*)-8-acetyl-6,8,10,11-tetrahydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicinone),

C. doxorubicin,

D. daunorubicin,

E. (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy- α -*L*-lyxo-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (dihydrodaunorubicin),

F. (8*S*,10*S*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy- α -*L*-arabino-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (*epi*-daunorubicin),

G. 8,8'-[(2*R*,4*R*)-4-hydroxy-2-(hydroxymethyl)-1,3-dioxolan-2,4-diyl]bis[(8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy- α -*L*-arabino-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione] (epirubicin dimer).

01/2005:1825

EQUISETUM STEM

Equiseti herba

DEFINITION

Whole or cut, dried sterile aerial parts of *Equisetum arvense* L.

Content: minimum 0.3 per cent of total flavonoids expressed as isoquercitroside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. It consists of fragments of grooved stems and linear leaves, light green to greenish-grey. They are rough to the touch, brittle and crunchy when crushed. The main stems are about 0.8 mm to 4.5 mm in diameter, hollow, jointed at the nodes which occur at intervals of about 1.5 cm to 4.5 cm; distinct vertical grooves are present on the internodes, ranging in number from 4 to 14 or more. Verticils of widely spaced and erect branches, usually simple, each about 1 mm thick with 2 to 4 longitudinal grooves, occur at the nodes. The leaves are small, linear, verticillate at each node, concrescent at the base, they form a toothed sheath around the stem; with the number of teeth corresponding to the number of grooves on the stem. Each tooth, often brown, is lanceolate-triangular. The lowest internode of each branch is longer than the sheath of the stem it belongs to.
- B. Reduce to a powder (355). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view, composed of rectangular cells with wavy walls and paracytic stomata (2.8.3) with the 2 subsidiary cells covering the guard cells and having conspicuous radial ridges; in transverse sectional view the epidermis is crenate, with the protuberances formed from the contiguous walls of 2 adjacent, U-shaped cells. Fragments

of large-celled parenchyma and groups of long, non-lignified fibres with narrow lumens; scattered small, lignified vessels with spiral or annular thickening.

- C. Examine the chromatograms obtained in the test for other *Equisetum* species and hybrids.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a greenish-blue fluorescent zone	2 red fluorescent zones
_____	2 greenish-blue fluorescent zones
_____	An orange fluorescent zone
Hyperoside: an orange fluorescent zone	2 greenish-blue fluorescent zones
_____	_____
Rutin: an orange fluorescent zone	_____
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 5 per cent of stems from other *Equisetum* species and hybrids and maximum 2 per cent of other foreign matter.

Other *Equisetum* species and hybrids. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min with occasional shaking. Allow to cool. Filter.

Reference solution. Dissolve 1.0 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 V/V/V/V).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the test solution shows no yellow or greenish-yellow fluorescent zone shortly above the starting line.

Loss on drying (2.2.32): maximum 10 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Ash insoluble in hydrochloric acid (2.8.1): minimum 3.0 per cent and maximum 15.0 per cent.

Total ash (2.4.16): minimum 12.0 per cent and maximum 27.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, introduce 0.800 g of the powdered drug (355), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool and filter each extract through a plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a filter paper into a volumetric flask and dilute to 100.0 ml with *acetone R* by rinsing the flask and the filter paper. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Compensation solution. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation solution at 425 nm. Calculate the percentage content of flavonoids, calculated as isoquercitroside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500,

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

01/2005:0082

ERGOCALCIFEROL

Ergocalciferolum

$C_{28}H_{44}O$

M_r 396.7

DEFINITION

Ergocalciferol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of (5Z,7E,22E)-9,10-secoergosta-5,7,10(19),22-tetraen-3β-ol.

1 mg of ergocalciferol is equivalent to 40 000 IU of antirachitic activity (vitamin D) in rats.

CHARACTERS

A white or slightly yellowish, crystalline powder or white or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light. Solutions in volatile solvents are unstable and are to be used immediately.

A reversible isomerisation to pre-ergocalciferol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ergocalciferol CRS*. Examine the substances prepared as discs.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.200 g rapidly and without heating in *aldehyde-free alcohol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation, determined within 30 min of preparing the solution, is + 103 to + 107.

Reducing substances. Dissolve 0.1 g in *aldehyde-free alcohol R* and dilute to 10.0 ml with the same solvent. Add 0.5 ml of a 5 g/l solution of *tetrazolium blue R* in *aldehyde-free alcohol R* and 0.5 ml of *dilute tetramethylammonium hydroxide solution R*. Allow to stand for exactly 5 min and add 1.0 ml of *glacial acetic acid R*. Prepare a reference solution at the same time and in the same manner using 10.0 ml of a solution containing 0.2 µg/ml of *hydroquinone R* in *aldehyde-free alcohol R*. Measure the absorbance (2.2.25) of the two solutions at 525 nm using as the compensation liquid 10.0 ml of *aldehyde-free alcohol R* treated in the same manner. The absorbance of the test solution is not greater than that of the reference solution (20 ppm).

Ergosterol. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.25 g of the substance to be examined in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 5 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 0.10 g of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 2 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dissolve 5 mg of *ergosterol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 50 ml with the same solvent. Prepare immediately before use.

Reference solution (c). Mix equal volumes of reference solution (a) and reference solution (b). Prepare immediately before use.

Apply to the plate 10 µl of the test solution, 10 µl of reference solution (a), 10 µl of reference solution (b) and 20 µl of reference solution (c). Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/l of *butylhydroxytoluene R*. Allow the plate to dry in air and spray three times with *antimony trichloride solution R1*. Examine the chromatograms for 3 min to 4 min

after spraying. The principal spot in the chromatogram obtained with the test solution is initially orange-yellow and then becomes brown. In the chromatogram obtained with the test solution, any slowly appearing violet spot (corresponding to ergosterol) immediately below the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). There is no spot in the chromatogram obtained with the test solution that does not correspond to one of the spots in the chromatograms obtained with reference solutions (a) and (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

ASSAY

Carry out the operations as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *ergocalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks corresponding to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the percentage content of ergocalciferol from the expression:

$$\frac{m'}{m} \times \frac{S_D}{S'_D} \times 100$$

- m* = mass of the substance to be examined in the test solution, in milligrams,
- m'* = mass of *ergocalciferol CRS* in reference solution (a), in milligrams,

- S_D = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with the test solution,
- S'_D = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with reference solution (a).

STORAGE

Store in an airtight container, under nitrogen, protected from light, at a temperature between 2 °C and 8 °C. The contents of an opened container are to be used immediately.

IMPURITIES

A. (5*E*,7*E*,22*E*)-9,10-secoergosta-5,7,10(19),22-tetraen-3β-ol (*trans*-vitamin D₂),

B. (22*E*)-ergosta-5,7,22-trien-3β-ol (ergosterol),

C. (9β,10α,22*E*)-ergosta-5,7,22-trien-3β-ol (lumisterol₂),

D. (6*E*,22*E*)-9,10-secoergosta-5(10),6,8(14),22-tetraen-3β-ol (iso-tachysterol₂),

E. (6*E*,22*E*)-9,10-secoergosta-5(10),6,8,22-tetraen-3β-ol (tachysterol₂).

01/2005:0223

ERGOMETRINE MALEATE

Ergometrini maleas

 $C_{23}H_{27}N_3O_6$ M_r 441.5

DEFINITION

Ergometrine maleate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (6*aR*,9*R*)-*N*[(*S*)-2-hydroxy-1-methylethyl]-7-methyl-4,6,6*a*,7,8,9-hexahydro-indolo[4,3-*fg*]quinoline-9-carboxamide maleate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly coloured, crystalline powder, sparingly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- Dissolve 30 mg in 0.01 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric acid. Examined between 250 nm and 360 nm (2.2.25), the solution shows an absorption maximum at 311 nm and a minimum at 265 nm to 272 nm. The specific absorbance at the maximum is 175 to 195.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ergometrine maleate* CRS. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 0.1 ml of solution S (see Tests) add 1 ml of *glacial acetic acid R*, 0.05 ml of *ferric chloride solution R1* and 1 ml of *phosphoric acid R* and heat in a water-bath at 80 °C. After about 10 min, a blue or violet colour develops which becomes more intense on standing.

E. Dissolve 0.1 g in a mixture of 0.5 ml of *dilute sulphuric acid R* and 2.5 ml of *water R*. Add 5 ml of *ether R* and 1 ml of *strong sodium hydroxide solution R* and shake. Separate the aqueous layer and shake with two quantities, each of 5 ml, of *ether R*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min. No colour develops. To the rest of the aqueous layer add 1 ml of *bromine water R*. Heat on a water-bath for 10 min, then heat to boiling and cool. To 0.2 ml of this solution add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min. A pinkish-violet colour develops.

TESTS

Solution S. Dissolve 0.100 g, without heating and protected from light, in 9 ml of *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ or BY₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.6 to 4.4.

Specific optical rotation (2.2.7): + 50 to + 56, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance. Carry out all operations as rapidly as possible, protected from light. Prepare the test and reference solutions immediately before use.

Test solution (a). Dissolve 50 mg of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol (80 per cent V/V) R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol (80 per cent V/V) R*.

Reference solution (a). Dissolve 10 mg of *ergometrine maleate CRS* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol (80 per cent V/V) R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol (80 per cent V/V) R*.

Reference solution (c). To 2.0 ml of reference solution (b) add 2.0 ml of a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol (80 per cent V/V) R*.

Apply separately to the plate 5 µl of each solution. Develop immediately over a path of 14 cm using a mixture of 3 volumes of *water R*, 25 volumes of *methanol R* and 75 volumes of *chloroform R*. Dry the plate in a current of cold air and spray with *dimethylaminobenzaldehyde solution R7*. Dry the plate in a current of warm air for about 2 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (1.0 per cent) and at most one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 0.20 g by drying over *diphosphorus pentoxide R* at 80 °C at a pressure not exceeding 2.7 kPa for 2 h.

ASSAY

Dissolve 0.150 g in 40 ml of *anhydrous acetic acid R*. Titrate with 0.05 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.05 M *perchloric acid* is equivalent to 22.07 mg of C₂₃H₂₇N₃O₆.

STORAGE

Store in an airtight, glass container, protected from light, at a temperature of 2 °C to 8 °C.

01/2005:0224

ERGOTAMINE TARTRATE

Ergotamini tartras

C₇₀H₇₆N₁₀O₁₆M_r 1313

DEFINITION

Ergotamine tartrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of bis[(6aR,9R)-N-[(2R,5S,10aS,10bS)-5-benzyl-10b-hydroxy-2-methyl-3,6-dioxo-octahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-fg]quinoline-9-carboxamide] tartrate, calculated with reference to the dried substance. It may contain two molecules of methanol of crystallisation.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, slightly hygroscopic, slightly soluble in alcohol. Aqueous solutions slowly become cloudy owing to hydrolysis; this may be prevented by the addition of tartaric acid.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

A. Dissolve 50 mg in 0.01 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 M *hydrochloric acid*. Examined between 250 nm and 360 nm (2.2.25), the solution shows an absorption maximum at 311 nm to 321 nm and a minimum at 265 nm to 275 nm. The specific absorbance at the maximum is 118 to 128, calculated with reference to the dried substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ergotamine tartrate CRS*. Examine the substances as discs prepared as follows: triturate the substance to be examined and the reference substance separately with 0.2 ml of *methanol R* and then with *potassium bromide R* as prescribed in the general method.

- C. Examine for not more than 1 min in ultraviolet light at 365 nm the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and fluorescence to the principal spot in the chromatogram obtained with reference solution (a). After spraying with *dimethylaminobenzaldehyde solution R7*, examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To 0.1 ml of solution S (see Tests) add 1 ml of *glacial acetic acid R*, 0.05 ml of *ferric chloride solution R1* and 1 ml of *phosphoric acid R* and heat in a water-bath at 80 °C. After about 10 min, a blue or violet colour develops which becomes more intense on standing.
- E. Dissolve about 10 mg in 1.0 ml of 0.1 M *sodium hydroxide*. Transfer to a separating funnel and shake with 5 ml of *methylene chloride R*. Discard the organic layer. Neutralise the aqueous layer with a few drops of *dilute hydrochloric acid R*. 0.1 ml of this solution gives reaction (b) of tartrates (2.3.1). Pour the reaction mixture into 1 ml of *water R* to observe the colour change to red or brownish-red.

TESTS

Carry out all operations as rapidly as possible, protected from light.

Solution S. Triturate 30 mg finely with about 15 mg of *tartaric acid R* and dissolve with shaking in 6 ml of *water R*.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

pH (2.2.3). Shake 10 mg, finely powdered, with 4 ml of *carbon dioxide-free water R*. The pH of the suspension is 4.0 to 5.5.

Specific optical rotation (2.2.7). Dissolve 0.40 g in 40 ml of a 10 g/l solution of *tartaric acid R*. Add 0.5 g of *sodium hydrogen carbonate R* cautiously in several portions and mix thoroughly. Shake with four quantities, each of 10 ml, of *chloroform R* previously washed with five quantities of *water R*, each of 50 ml per 100 ml of *chloroform R*. Combine the organic layers. Filter through a small filter moistened with *chloroform R* previously washed as described above. Dilute the filtrate to 50.0 ml with *chloroform R* previously washed as described above. Measure the angle of rotation.

Determine the amount of ergotamine base in the chloroformic solution as follows: to 25.0 ml of the solution add 50 ml of *anhydrous acetic acid R* and titrate with 0.05 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.05 M *perchloric acid* is equivalent to 29.08 mg of C₃₃H₃₅N₅O₅.

The specific optical rotation is –154 to –165, calculated from the angle of rotation and the concentration of ergotamine base.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*. Prepare the reference solutions and the test solutions immediately before use and in the order indicated below.

Reference solution (a). Dissolve 10 mg of *ergotamine tartrate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 7.5 ml of reference solution (a) to 50.0 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (c). To 2.0 ml of reference solution (b) add 4.0 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Test solution (a). Dissolve 50 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Apply immediately to the plate 5 µl of each reference solution and then 5 µl of each test solution. Expose the starting points immediately to ammonia vapour and for exactly 20 s by moving the starting line from side to side above a beaker 55 mm high and 45 mm in diameter containing about 20 ml of *concentrated ammonia R*. Dry the starting line in a current of cold air for exactly 20 s. Develop immediately over a path of 17 cm using a mixture of 5 volumes of *ethanol R*, 10 volumes of *methylene chloride R*, 15 volumes of *dimethylformamide R* and 70 volumes of *ether R*. Dry the plate in a current of cold air for about 2 min. Examine for not more than 1 min in ultraviolet light at 365 nm for the identification. Spray the plate abundantly with *dimethylaminobenzaldehyde solution R7* and dry in a current of warm air for about 2 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (1.5 per cent) and at most one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Loss on drying (2.2.32). Not more than 6.0 per cent, determined on 0.100 g by drying *in vacuo* at 95 °C for 6 h.

ASSAY

Dissolve 0.200 g in 40 ml of *anhydrous acetic acid R*. Titrate with 0.05 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.05 M *perchloric acid* is equivalent to 32.84 mg of C₇₀H₇₆N₁₀O₁₆.

STORAGE

Store in an airtight, glass container, protected from light, at a temperature of 2 °C to 8 °C.

01/2005:1803

ERYTHRITOL

Erythritolum

C₄H₁₀O₄M_r 122.1

DEFINITION

(2R,3S)-Butane-1,2,3,4-tetrol (*meso*-erythritol).

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or free-flowing granules.

Solubility: freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

A. Melting point (2.2.14): 119 °C to 122 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: erythritol CRS.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 5.0 g in *water R* and dilute to 50 ml with the same solvent.

Conductivity (2.2.38): maximum 20 $\mu\text{S}\cdot\text{cm}^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution, while gently stirring with a magnetic stirrer.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 0.50 g of *erythritol CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water R*.

Reference solution (d). Dissolve 1.0 g of *erythritol R* and 1.0 g of *glycerol R* in *water R* and dilute to 20.0 ml with the same solvent.

Column:

- *size:* $l = 0.3 \text{ m}$, $\varnothing = 7.8 \text{ mm}$,
- *stationary phase:* cation-exchange resin *R* (9 μm),
- *temperature:* 70 °C.

Mobile phase: 0.01 per cent *V/V* solution of *sulphuric acid R*.

Flow rate: 0.8 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 μl ; inject the test solution and reference solutions (b), (c) and (d).

Run time: 3 times the retention time of erythritol.

Relative retention with reference to erythritol (retention time = about 11 min): impurity A = about 0.77; impurity B = about 0.90; impurity C = about 0.94; impurity D = about 1.10.

System suitability: reference solution (d):

- *resolution:* minimum 2 between the peaks due to erythritol and impurity D.

Limits:

- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- *total:* not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- *disregard limit:* area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Lead (2.4.10): maximum 0.5 ppm.

Water (2.5.12): maximum 0.5 per cent, determined on 1.00 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13). If intended for use in the manufacture of parenteral dosage forms, the total viable aerobic count (2.6.12) is not more than 10^2 bacteria and 10^2 fungi per gram, determined by plate count.

Bacterial endotoxins (2.6.14). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins:

- less than 4 IU/g for parenteral dosage forms having a concentration of 100 g/l or less of erythritol,
- less than 2.5 IU/g for parenteral dosage forms having a concentration of more than 100 g/l of erythritol.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of erythritol using the chromatogram obtained with reference solution (a) and the declared content of *erythritol CRS*.

LABELLING

The label states where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. maltitol,

B. sorbitol,

C. (2*R*,3*S*,4*S*)-pentane-1,2,3,4,5-pentol (*meso*-ribitol),

D. glycerol.

01/2005:0179

ERYTHROMYCIN

Erythromycinum

Erythromycin	Mol. Formula	M _r	R1	R2
A	C ₃₇ H ₆₇ NO ₁₃	734	OH	CH ₃
B	C ₃₇ H ₆₇ NO ₁₂	718	H	CH ₃
C	C ₃₆ H ₆₅ NO ₁₃	720	OH	H

DEFINITION

Mixture of macrolide antibiotics produced by a strain of *Streptomyces erythreus*, the main component being (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -*L*-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[(3,4,6-trideoxy-3-dimethylamino- β -*D*-xylo-hexopyranosyl)-oxy]oxacyclotetradecane-2,10-dione (erythromycin A).

Content:

- sum of the contents of erythromycin A, erythromycin B and erythromycin C: 93.0 per cent to 102.0 per cent (anhydrous substance),
- erythromycin B: maximum 5.0 per cent,
- erythromycin C: maximum 5.0 per cent.

CHARACTERS

Appearance: white or slightly yellow powder or colourless or slightly yellow crystals, slightly hygroscopic.

Solubility: slightly soluble in water (the solubility decreases as the temperature rises), freely soluble in alcohol, soluble in methanol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: erythromycin CRS.

Disregard any band in the region from 1980 cm⁻¹ to 2050 cm⁻¹.

If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and of the reference substance separately in 1.0 ml of *methylene chloride R*, dry at 60 °C at a pressure not exceeding 670 Pa for 3 h and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *erythromycin A CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *spiramycin CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate *R*.

Mobile phase: mix 4 volumes of *2-propanol R*, 8 volumes of a 150 g/l solution of *ammonium acetate R* previously adjusted to pH 9.6 with *ammonia R* and 9 volumes of *ethyl acetate R*. Allow to settle and use the upper layer.

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *anisaldehyde solution R1* and heat at 110 °C for 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and its position and colour are different from those of the spots in the chromatogram obtained with reference solution (b).

- C. To about 5 mg add 5 ml of a 0.2 g/l solution of *xanthidrol R* in a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *acetic acid R* and heat on a water-bath. A red colour develops.
- D. Dissolve about 10 mg in 5 ml of *hydrochloric acid R1* and allow to stand for 10-20 min. A yellow colour develops.

TESTS

Specific optical rotation (2.2.7): –71 to –78 (anhydrous substance).

Dissolve 1.00 g in *ethanol R* and dilute to 50.0 ml with the same solvent. The specific optical rotation is determined at least 30 min after preparing the solution.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R1* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 40.0 mg of *erythromycin A CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R1* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10.0 mg of *erythromycin B CRS* and 10.0 mg of *erythromycin C CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R1* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (c). Dissolve 5 mg of *N-demethyl-erythromycin A CRS* in reference solution (b). Add 1.0 ml of reference solution (a) and dilute to 25 ml with reference solution (b).

Reference solution (d). Dilute 3.0 ml of reference solution (a) to 100.0 ml with a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R1*.

Reference solution (e). Transfer 40 mg of *erythromycin A CRS* to a glass vial and spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130 °C for 4 h. Allow to cool and dissolve in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R1* and dilute to 10 ml with the same mixture of solvents.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (8 μ m) with a pore size of 100 nm,
- **temperature:** 70 °C using a water-bath for the column and at least one-third of the tubing preceding the column.

Mobile phase: to 50 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 ± 0.05 with *dilute phosphoric acid R*, add 400 ml of *water R*, 165 ml of *2-methyl-2-propanol R* and 30 ml of *acetonitrile R*, and dilute to 1000 ml with *water R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 100 μ l; inject the test solution and reference solutions (c), (d) and (e).

Run time: 5 times the retention time of erythromycin A.

Relative retention with reference to erythromycin A (retention time = about 15 min): impurity A = about 0.3; impurity B = about 0.45; erythromycin C = about 0.5; impurity C = about 0.9; impurity D = about 1.4; impurity F = about 1.5; erythromycin B = about 1.8; impurity E = about 4.3.

System suitability: reference solution (c):

- **resolution:** minimum 0.8 between the peaks due to impurity B and erythromycin C and minimum 5.5 between the peaks due to impurity B and erythromycin A. If necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase or reduce the flow rate to 1.5 ml or 1.0 ml/min.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities (use the chromatogram obtained with reference solution (e) to identify them) by the corresponding correction factor: impurity E = 0.09; impurity F = 0.15,
- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (3.0 per cent),
- **total:** not more than 2.3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (7.0 per cent),
- **disregard limit:** 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.06 per cent); disregard the peaks due to erythromycin B and erythromycin C.

Thiocyanate: maximum 0.3 per cent.

Prepare the solutions immediately before use and protect from actinic light.

Compensation liquid. Dilute 1.0 ml of a 90 g/l solution of *ferric chloride R* to 50.0 ml with *methanol R*.

Test solution. Dissolve 0.100 g (m g) of the substance to be examined in 20 ml of *methanol R*, add 1.0 ml of a 90 g/l solution of *ferric chloride R* and dilute to 50.0 ml with *methanol R*.

Prepare 2 independent reference solutions.

Reference solution. Dissolve 0.100 g of *potassium thiocyanate R*, previously dried at 105 °C for 1 h, in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml to 50.0 ml with *methanol R*. To 5.0 ml of this solution, add 1.0 ml of a 90 g/l solution of *ferric chloride R* and dilute to 50.0 ml with *methanol R*.

Measure the absorbances (2.2.25) of each reference solution (A_1 , A_2) and of the test solution (A) at the maximum (about 492 nm).

Suitability value:

$$S = \frac{m_2 \times A_1}{m_1 \times A_2}$$

m_1 , m_2 = mass of the potassium thiocyanate used to prepare the respective reference solutions, in grams.

The test is not valid unless S is not less than 0.985 and not more than 1.015.

Calculate the percentage content of thiocyanate from the expression:

$$\frac{A \times 58.08 \times 0.5}{m \times 97.18} \times \left(\frac{m_1}{A_1} + \frac{m_2}{A_2} \right)$$

58.08 = relative molecular mass of the thiocyanate moiety,

97.18 = relative molecular mass of potassium thiocyanate.

Water (2.5.12): maximum 6.5 per cent, determined on 0.200 g.

Use a 100 g/l solution of *imidazole R* in *anhydrous methanol R* as the solvent.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: test solution and reference solutions (a) and (b).

System suitability: reference solution (a):

- **repeatability:** maximum relative standard deviation of 1.2 per cent for 6 replicate injections.

Calculate the percentage content of erythromycin A using the chromatogram obtained with reference solution (a). Calculate the percentage contents of erythromycin B and erythromycin C using the chromatogram obtained with reference solution (b).

STORAGE

Protected from light.

IMPURITIES

A. R1 = OH, R2 = CH₃: erythromycin F,

B. R1 = R2 = H: *N*-demethylerythromycin A,

01/2005:0552

ERYTHROMYCIN ESTOLATE

Erythromycini estolas

C. erythromycin E,

D. anhydroerythromycin A,

E. erythromycin A enol ether,

F. pseudoerythromycin A enol ether.

 $C_{52}H_{97}NO_{18}S$ M_r 1056

DEFINITION

Erythromycin estolate (or erythromycin 2'-propionate dodecyl sulphate) is (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-2-*O*-propionyl- β -D-*xylo*-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione dodecyl sulphate. The potency is not less than 610 IU/mg, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, freely soluble in alcohol, soluble in acetone. It is practically insoluble in dilute hydrochloric acid.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *erythromycin estolate CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and colour to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.
- Suspend about 3 mg in 2 ml of *dilute sulphuric acid R*. Add 0.1 ml of a 0.1 g/l solution of *methylene blue R* and 2 ml of *chloroform R* and shake. The chloroform layer is blue.
- Dissolve about 10 mg in 5 ml of *hydrochloric acid R1* and allow to stand for 10 min to 20 min. A yellow colour develops.

TESTS

pH (2.2.3). Suspend 0.4 g in 10 ml of *carbon dioxide-free water R*. Shake for 5 min and allow to stand. The pH of the clear supernatant liquid is 5.5 to 7.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

01/2005:0274

Test solution (a). Dissolve 40 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2.5 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *erythromycin estolate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *erythromycin estolate CRS* and 10 mg of *erythromycin ethylsuccinate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 8 mg of *erythromycin CRS* in *acetone R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of a 150 g/l solution of *ammonium acetate R* previously adjusted to pH 7.0, 15 volumes of *alcohol R* and 85 volumes of *chloroform R*. Allow the plate to dry in air and spray with *anisaldehyde solution R*. Heat at 110 °C for 5 min and allow to cool. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (c) (2.0 per cent).

Dodecyl sulphate. 23.0 per cent to 25.5 per cent of $C_{12}H_{26}O_4S$, calculated with reference to the anhydrous substance. Dissolve 0.500 g of the substance to be examined in 25 ml of *dimethylformamide R*. Titrate with 0.1 M *sodium methoxide* using 0.05 ml of a 3 g/l solution of *thymol blue R* in *methanol R* as indicator.

1 ml of 0.1 M *sodium methoxide* is equivalent to 26.64 mg of $C_{12}H_{26}O_4S$.

Water (2.5.12). Not more than 4.0 per cent, determined on 0.300 g by the semi-micro determination of water. Use a 100 g/l solution of *imidazole R* in *anhydrous methanol R* as the solvent.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 0.5 g.

ASSAY

Dissolve 40.0 mg in 40 ml of *methanol R*, add 20 ml of *phosphate buffer solution pH 7.0 R* and dilute to 100.0 ml with *water R*. Maintain at 60 °C for 3 h and allow to cool. Carry out the microbiological assay of antibiotics (2.7.2). Use *erythromycin CRS* as the reference substance.

STORAGE

Store in an airtight container, protected from light, at a temperature below 30 °C.

ERYTHROMYCIN ETHYLSUCCINATE

Erythromycini ethylsuccinas

Ethylsuccinate compound	Mol. Formula	M_r	R1	R2
Erythromycin A	$C_{43}H_{75}NO_{16}$	862	OH	CH_3
Erythromycin B	$C_{43}H_{75}NO_{15}$	846	H	CH_3
Erythromycin C	$C_{42}H_{73}NO_{16}$	848	OH	H

DEFINITION

Main component: (3R,4S,5S,6R,7R,9R,11R,12R,13S,14R)-4-[(2,6-dideoxy-3-C-methyl-3-O-methyl- α -L-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-2-O-(4-ethoxy-4-oxobutanoyl)- β -D-xyllo-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (erythromycin A ethylsuccinate).

Content:

- sum of erythromycin A, erythromycin B and erythromycin C: minimum 78.0 per cent (anhydrous substance),
- erythromycin B: maximum 5.0 per cent (anhydrous substance),
- erythromycin C: maximum 5.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder, hygroscopic.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol and in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *erythromycin ethylsuccinate CRS*.

TESTS

Specific optical rotation (2.2.7): -70 to -82 (anhydrous substance).

Dissolve 0.100 g in *acetone R* and dilute to 10.0 ml with the same solvent. Measure the angle of rotation at least 30 min after preparing the solution.

Related substances. Liquid chromatography (2.2.29).

Hydrolysis solution. A 20 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 8.0 with *phosphoric acid R*.

Test solution. Dissolve 0.115 g of the substance to be examined in 25 ml of *methanol R*. Add 20 ml of the hydrolysis solution, mix and allow to stand at room temperature for at least 12 h. Dilute to 50.0 ml with the hydrolysis solution.

Reference solution (a). Dissolve 40.0 mg of erythromycin A CRS in 10 ml of methanol R and dilute to 20.0 ml with the hydrolysis solution.

Reference solution (b). Dissolve 10.0 mg of erythromycin B CRS and 10.0 mg of erythromycin C CRS in 50 ml of methanol R. Add 5.0 ml of reference solution (a) and dilute to 100.0 ml with the hydrolysis solution.

Reference solution (c). Dissolve 2 mg of *N*-demethylethylerythromycin A CRS in 20 ml of reference solution (b).

Reference solution (d). Dilute 3.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of methanol R and the hydrolysis solution.

Reference solution (e). Dissolve 40 mg of erythromycin A CRS, previously heated at 130 °C for 3 h, in 10 ml of methanol R and dilute to 20 ml with the hydrolysis solution.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: styrene-divinylbenzene copolymer R (8 μ m) with a pore size of 100 nm,
- temperature: 70 °C using a water-bath for the column and at least one third of the tubing preceding the column.

Mobile phase: to 50 ml of a 35 g/l solution of dipotassium hydrogen phosphate R adjusted to pH 8.0 with dilute phosphoric acid R, add 400 ml of water R, 165 ml of 2-methyl-2-propanol R and 30 ml of acetonitrile R, and dilute to 1000 ml with water R.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 200 μ l; inject the test solution and reference solutions (a), (c), (d) and (e).

Run time: 5 times the retention time of erythromycin A; begin integration after the hydrolysis peak.

Relative retention with reference to erythromycin A (retention time = about 15 min): hydrolysis peak = less than 0.3; impurity B = about 0.45; erythromycin C = about 0.5; impurity C = about 0.9; impurity G = about 1.3; impurity D = about 1.4; impurity F = about 1.5; erythromycin B = about 1.8; impurity E = about 4.3.

System suitability: reference solution (c):

- resolution: minimum 0.8 between the peaks due to impurity B and to erythromycin C and minimum 5.5 between the peaks due to impurity B and to erythromycin A.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity E = 0.09; impurity F = 0.15; impurity G = 0.14; use the chromatogram obtained with reference solution (e) to identify the peaks due to impurities E and F.
- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (3.0 per cent).

- total: not more than 1.67 times the area of the principal peak in the chromatogram obtained with reference solution (d) (5.0 per cent).
- disregard limit: 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.06 per cent).

Free erythromycin. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.250 g of the substance to be examined in acetonitrile R and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 75.0 mg of erythromycin A CRS in acetonitrile R and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with acetonitrile R.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix 35 volumes of acetonitrile R and 65 volumes of a solution containing 3.4 g/l of potassium dihydrogen phosphate R and 2.0 g/l of triethylamine R, adjusted to pH 3.0 with dilute phosphoric acid R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 195 nm.

Injection: 20 μ l.

Run time: twice the retention time of erythromycin A (retention time = about 8 min) for the reference solution and twice the retention time of erythromycin ethylsuccinate (retention time = about 24 min) for the test solution.

Limit:

- free erythromycin: not more than the area of the principal peak in the chromatogram obtained with the reference solution (6.0 per cent).

Water (2.5.12): maximum 3.0 per cent, determined on 0.30 g.

Use a 100 g/l solution of imidazole R in anhydrous methanol R as the solvent.

Sulphated ash (2.4.14): maximum 0.3 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: inject the test solution and reference solutions (a) and (b).

System suitability: reference solution (a):

- relative standard deviation: maximum 1.2 per cent for 6 replicate injections.

Calculate the percentage content of erythromycin A using the chromatogram obtained with reference solution (a). Calculate the percentage contents of erythromycin B and erythromycin C using the chromatogram obtained with reference solution (b).

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. R1 = OH, R2 = CH₃: erythromycin F,

B. R1 = R2 = H: *N*-demethylerythromycin A,

C. erythromycin E,

D. anhydroerythromycin A,

E. erythromycin A enol ether,

F. pseudoerythromycin A enol ether,

G. erythromycin *N*-ethylsuccinate.

01/2005:1098

ERYTHROMYCIN LACTOBIONATE

Erythromycini lactobionas

C₄₉H₈₉NO₂₅

*M*_r 1092

DEFINITION

Erythromycin lactobionate is a mixture of lactobionates of macrolide antibiotics. The main component is (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -*L*-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[[3,4,6-trideoxy-3-(dimethylamino)- β -*D*-xylo-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione 4-*O*- β -*D*-galactopyranosyl-*D*-gluconate. The sum of the content of erythromycin A lactobionate, of erythromycin B lactobionate and of erythromycin C lactobionate is not less than 93.0 per cent and not more than the equivalent of 100.5 per cent, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellow powder, hygroscopic, soluble in water, freely soluble in ethanol and in methanol, very slightly soluble in acetone and in methylene chloride.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27) using *silica gel H R* as the coating substance.

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *erythromycin A CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *lactobionic acid R* in *water R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *glacial acetic acid R*, 10 volumes of *water R* and 90 volumes of *methanol R*. Allow the plate to dry in air, spray with a 5 g/l solution of *potassium permanganate R* in 1 M *sodium hydroxide* and heat at 110 °C for 5 min. The chromatogram obtained with the test solution shows two spots, one of which corresponds in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and the other to the principal spot in the chromatogram obtained with reference solution (b).

- B. To about 5 mg add 5 ml of a 0.2 g/l solution of *xanthidrol R* in a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *acetic acid R*. A red colour develops.
- C. Dissolve about 10 mg in 5 ml of *hydrochloric acid R1*. A yellowish-green colour develops.

TESTS

Appearance of solution. Dissolve 1.0 g in 20 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent. The pH of the solution is 6.5 to 7.5.

Related substances. Examine by liquid chromatography (2.2.29), as described under Assay. The content of erythromycin B lactobionate and that of erythromycin C lactobionate is not greater than 5.0 per cent. Inject reference solution (d). Inject the test solution and continue the chromatography for five times the retention time of erythromycin A. In the chromatogram obtained with the test solution, the area of any peak, apart from the peaks corresponding to erythromycin A, erythromycin B or erythromycin C, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (3.0 per cent).

Free lactobionic acid. Not more than 1.0 per cent of $C_{12}H_{22}O_{12}$, calculated with reference to the anhydrous substance. Dissolve 0.400 g in 50 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Calculate the volume of 0.1 M *sodium hydroxide* required per gram of the substance to be examined (n_1 ml). Dissolve 0.500 g in 40 ml of *anhydrous acetic acid R* and titrate with 0.1 M *perchloric*

acid, determining the end-point potentiometrically (2.2.20). Calculate the volume of 0.1 M *perchloric acid* required per gram of the substance to be examined (n_2 ml).

Calculate the percentage content of $C_{12}H_{22}O_{12}$ from the expression:

$$3.580 (n_1 - n_2)$$

Water (2.5.12). Not more than 5.0 per cent, determined on 0.200 g by the semi-micro determination of water. Use a 100 g/l solution of *imidazole R* in *anhydrous methanol R* as the solvent.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of a solution in *water for injections R* containing 7.4 mg of the substance to be examined per millilitre (equivalent to 5 mg of erythromycin).

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 60.0 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 40.0 mg of *erythromycin A CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10.0 mg of *erythromycin B CRS* and 10.0 mg of *erythromycin C CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (c). Dissolve 5 mg of *N-demethyl-erythromycin A CRS* in reference solution (b). Add 1.0 ml of reference solution (a) and dilute to 25 ml with reference solution (b).

Reference solution (d). Dilute 3.0 ml of reference solution (a) to 100.0 ml with a mixture of 1 volume of *methanol R* and 3 volumes of *phosphate buffer solution pH 7.0 R*.

The test solution and the reference solutions can be used within one day if stored at 5 °C.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *styrene-divinylbenzene copolymer R* (8 µm to 10 µm) with a pore size of 100 nm,
- as mobile phase at a flow rate of 2.0 ml/min a solution prepared as follows: to 50 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 with *dilute phosphoric acid R*, add 400 ml of *water R*, 165 ml of *2-methyl-2-propanol R* and 30 ml of *acetonitrile R*, and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 215 nm,
- a 100 µl injector,
- an electronic integrator,

maintaining the column at 70 °C, preferably using a water-bath. Inject reference solution (c). Adjust the sensitivity of the system so that the height of the peaks is at least 25 per cent of the full scale of the recorder. The substances are eluted in the following order: *N-demethylerythromycin A*, erythromycin C,

erythromycin A and erythromycin B. The assay is not valid unless the resolution between the peaks corresponding to *N*-demethylethromycin A and erythromycin C is at least 0.8 and the resolution between the peaks corresponding to *N*-demethylethromycin A and erythromycin A is at least 5.5. If necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase or reduce the flow rate to 1.5 ml/min or 1.0 ml/min. Inject reference solution (a) six times. The assay is not valid unless the relative standard deviation of the area of the peak due to erythromycin A is at most 2.0 per cent. Inject alternately the test solution and reference solutions (a) and (b).

Calculate the percentage content of erythromycin A using the chromatogram obtained with reference solution (a). Express the result as erythromycin A lactobionate by multiplying the percentage content of erythromycin A by 1.4877. Calculate the percentage contents of erythromycin B and erythromycin C using the chromatogram obtained with reference solution (b). Express the result as erythromycin B lactobionate and as erythromycin C lactobionate by multiplying by 1.4877.

STORAGE

Store in an airtight container at a temperature not exceeding 25 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from pyrogens.

IMPURITIES

A. R1 = OH, R2 = CH₃: erythromycin F,

B. R1 = R2 = H: *N*-demethylethromycin A,

C. erythromycin E,

D. anhydroerythromycin A,

E. erythromycin A enol ether,

F. pseudoerythromycin A enol ether.

01/2005:0490

ERYTHROMYCIN STEARATE

Erythromycini stearas

Erythromycin	Mol. Formula	R1	R2
A	C ₅₅ H ₁₀₃ NO ₁₅	OH	CH ₃
B	C ₅₅ H ₁₀₃ NO ₁₄	H	CH ₃
C	C ₅₄ H ₁₀₁ NO ₁₅	OH	H

C₅₅H₁₀₃NO₁₅M_r 1018

DEFINITION

A mixture of the stearates of erythromycin and stearic acid. The main component is the octadecanoate of (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -*L*-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)- β -*D*-xylo-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (erythromycin A stearate).

Content:

- sum of the contents of erythromycin A, erythromycin B and erythromycin C: minimum 60.5 per cent (anhydrous substance),
- erythromycin B: maximum 5.0 per cent,
- erythromycin C: maximum 5.0 per cent.

CHARACTERS

Appearance: white, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone and in methanol.

Solutions may be opalescent.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: erythromycin stearate CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 28 mg of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of erythromycin A CRS in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of stearic acid *R* in methanol *R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel *G* plate *R*.

Mobile phase: mix 4 volumes of 2-propanol *R*, 8 volumes of a 150 g/l solution of ammonium acetate *R* previously adjusted to pH 9.6 with ammonia *R* and 9 volumes of ethyl acetate *R*. Allow to settle and use the upper layer.

Application: 5 μ l.

Development: over 2/3 of the plate.

Drying: in air.

Detection A: spray with a solution containing 0.2 g/l of dichlorofluorescein *R* and 0.1 g/l of rhodamine B *R* in alcohol *R*. Maintain the plate for a few seconds in the vapour above a water-bath. Examine in ultraviolet light at 365 nm.

Results A: the chromatogram obtained with the test solution shows 2 spots, one of which corresponds in position to the principal spot in the chromatogram obtained with reference solution (a) and the other to the principal spot in the chromatogram obtained with reference solution (b).

Detection B: spray the plate with anisaldehyde solution *R1*. Heat at 110 °C for 5 min and examine in daylight.

Results B: the spot in the chromatogram obtained with the test solution corresponds in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Free stearic acid: maximum 14.0 per cent (anhydrous substance) of C₁₈H₃₆O₂.

Dissolve 0.400 g in 50 ml of methanol *R*. Titrate with 0.1 *M* sodium hydroxide, determining the end-point potentiometrically (2.2.20). Calculate the volume of 0.1 *M* sodium hydroxide required per gram of the substance to be examined (n_1 ml). Dissolve 0.500 g in 30 ml of methylene chloride *R*. If the solution is opalescent, filter and shake the residue with 3 quantities, each of 25 ml, of methylene chloride *R*. Filter, if necessary, and rinse the filter with methylene chloride *R*. Reduce the volume of the combined filtrate and rinsings to 30 ml by evaporation on a water-bath. Add 50 ml of glacial acetic acid *R* and titrate with 0.1 *M* perchloric acid, determining the end-point potentiometrically (2.2.20). Calculate the volume of 0.1 *M* perchloric acid required per gram of the substance to be examined (n_2 ml).

Calculate the percentage content of C₁₈H₃₆O₂ from the expression:

$$2.845 (n_1 - n_2) \times \frac{100}{100 - h}$$

h = percentage water content.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 55.0 mg of the substance to be examined in 5.0 ml of methanol *R* and dilute to 10.0 ml with buffer solution pH 8.0 *R1*. Centrifuge and use the clear solution.

Reference solution (a). Dissolve 40.0 mg of erythromycin A CRS in 5.0 ml of methanol *R* and dilute to 10.0 ml with buffer solution pH 8.0 *R1*.

Reference solution (b). Dissolve 10.0 mg of erythromycin B CRS and 10.0 mg of erythromycin C CRS in 25.0 ml of methanol *R* and dilute to 50.0 ml with buffer solution pH 8.0 *R1*.

Reference solution (c). Dissolve 5 mg of *N*-demethylerythromycin A CRS in reference solution (b). Add 1.0 ml of reference solution (a) and dilute to 25 ml with reference solution (b).

Reference solution (d). Dilute 3.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of *methanol R* and *buffer solution pH 8.0 R1*.

Reference solution (e). Transfer 40 mg of *erythromycin A CRS* to a glass vial and spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130 °C for 4 h. Allow to cool and dissolve in a mixture of 1 volume of *methanol R* and 3 volumes of *buffer solution pH 8.0 R1* and dilute to 10 ml with the same mixture of solvents.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (8 μ m) with a pore size of 100 nm,
- **temperature:** 70 °C using a water-bath for the column and at least one third of the tubing preceding the column.

Mobile phase: to 50 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 ± 0.05 with *dilute phosphoric acid R*, add 400 ml of *water R*, 165 ml of *2-methyl-2-propanol R* and 30 ml of *acetonitrile R*, and dilute to 1000 ml with *water R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 100 μ l; inject the test solution and reference solutions (c), (d) and (e).

Run time: 5 times the retention time of erythromycin A.

Relative retention with reference to erythromycin A (retention time = about 15 min): impurity A = about 0.3; impurity B = about 0.45; erythromycin C = about 0.5; impurity C = about 0.9; impurity D = about 1.4; impurity F = about 1.5; erythromycin B = about 1.8; impurity E = about 4.3.

System suitability: reference solution (c):

- **resolution:** minimum 0.8 between the peaks due to impurity B and to erythromycin C and minimum 5.5 between the peaks due to impurity B and to erythromycin A. If necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase or reduce the flow rate to 1.5 ml/min or 1.0 ml/min.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities (use the chromatogram obtained with reference solution (e) to identify them) by the corresponding correction factor: impurity E = 0.09; impurity F = 0.15,
- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (3 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (6 per cent),
- **disregard limit:** 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.06 per cent); disregard the peaks due to erythromycin B and to erythromycin C.

Water (2.5.12): maximum 4.0 per cent, determined on 0.300 g.

Use a 100 g/l solution of *imidazole R* in *anhydrous methanol R* as the solvent.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: test solution and reference solutions (a) and (b).

System suitability: reference solution (a):

- **repeatability:** maximum relative standard deviation of 1.2 per cent for 6 replicate injections.

Calculate the percentage content of erythromycin A using the chromatogram obtained with reference solution (a). Calculate the percentage contents of erythromycin B and erythromycin C using the chromatogram obtained with reference solution (b).

IMPURITIES

A. R1 = OH, R2 = CH₃: erythromycin F,

B. R1 = R2 = H: *N*-demethylerythromycin A,

C. erythromycin E,

D. anhydroerythromycin A,

DEFINITION

Erythropoietin concentrated solution is a solution containing a family of closely-related glycoproteins which are indistinguishable from the naturally occurring human erythropoietin (urinary erythropoietin) in terms of amino acid sequence (165 amino acids) and average glycosylation pattern, at a concentration of 0.5 mg/ml to 10 mg/ml. It may also contain buffer salts and other excipients. It has a potency of not less than 100 000 IU/mg of active substance determined using the conditions described under Assay and in the test for protein.

PRODUCTION

Erythropoietin is produced in rodent cells *in vitro* by a method based on recombinant DNA technology.

Prior to batch release, the following tests are carried out on each batch of the final product, unless exemption has been granted by the competent authority.

Host cell-derived proteins: the limit is approved by the competent authority.

Host cell- and vector-derived DNA: the limit is approved by the competent authority.

CHARACTERS

Appearance: clear or slightly turbid colourless solution.

IDENTIFICATION

A. It gives the appropriate response when examined using the conditions described under Assay.

B. Capillary zone electrophoresis (2.2.47)

Test solution. Dilute the substance to be examined with *water R* to obtain a concentration of 1 mg/ml. Desalt 0.25 ml of the solution by passage through a micro-concentrator cartridge provided with a membrane with a molecular mass cut-off of not more than 10 000. Add 0.2 ml of *water R* to the sample and desalt again. Repeat the desalting procedure once more. Dilute the sample with *water R*, determine its protein concentration as described under Tests and adjust to a concentration of approximately 1 mg/ml with *water R*.

Reference solution. Dissolve the contents of a vial of *erythropoietin BRP* in 0.25 ml of *water R*. Proceed with desalting as described for the test solution.

Capillary:

- **material:** uncoated fused silica,
- **size:** effective length = about 100 cm, $\varnothing$ = 50 μ m,
- Temperature:** 35 °C.

CZE buffer concentrate (0.1 M sodium chloride, 0.1 M tricine, 0.1 M sodium acetate). Dissolve 0.584 g of sodium chloride *R*, 1.792 g of tricine *R* and 0.820 g of anhydrous sodium acetate *R* in *water R* and dilute to 100.0 ml with the same solvent.

1 M putrescine solution. Dissolve 0.882 g of putrescine *R* in 10 ml of *water R*. Distribute in 0.5 ml aliquots.

CZE buffer (0.01 M tricine, 0.01 M sodium chloride, 0.01 M sodium acetate, 7 M urea, 2.5 mM putrescine). Dissolve 21.0 g of urea *R* in 25 ml of *water R* by warming in a water-bath at 30 °C. Add 5.0 ml of CZE buffer concentrate and 125 μ l of 1 M putrescine solution. Dilute to 50.0 ml with *water R*. Using dilute acetic acid *R*, adjust to pH 5.55 at 30 °C and filter through a 0.45 μ m membrane filter.

Detection: spectrophotometer at 214 nm.

Set the autosampler to store the samples at 4 °C during analysis.

Preconditioning of the capillary: rinse the capillary for 60 min with 0.1 M sodium hydroxide filtered through a 0.45 μ m membrane filter and for 60 min with CZE buffer. Apply voltage for 12 h (20 kV).

Between-run rinsing: rinse the capillary for 10 min with *water R*, for 5 min with 0.1 M sodium hydroxide filtered through a 0.45 μ m membrane filter and for 10 min with CZE buffer.

Injection: under pressure or vacuum.

Migration: apply a field strength of 143 V/cm (15.4 kV for capillaries of 107 cm total length) for 80 min, using CZE buffer as the electrolyte in both buffer reservoirs.

System suitability: in the electropherogram obtained with the reference solution, a pattern of well separated peaks corresponding to the peaks in the *Ph. Eur. reference*

electropherogram of erythropoietin (Figure 1316.-1) is seen, and the largest peak is at least 50 times greater than the baseline noise. If necessary, adjust the sample load to give peaks of sufficient height. Identify the peaks corresponding to isoforms 1 to 8. The peak corresponding to isoform 1 is detected; the resolution between the peaks corresponding to isoforms 5 and 6 is not less than 1. Repeat the separation at least 3 times. The baseline is stable, showing little drift, and the distribution of peaks is qualitatively and quantitatively similar to the distribution of peaks in the *Ph. Eur. reference electropherogram of erythropoietin*. The relative standard deviation of the migration time of the peak corresponding to isoform 2 is less than 2 per cent.

Limits: identify the peaks corresponding to isoforms 1 to 8 in the electropherogram obtained with the test solution by comparison with the electropherogram obtained with the reference solution. Calculate the percentage content of each isoform from the corresponding peak area. The percentages are within the following ranges:

Isoform number	Content (per cent)
1	0 - 15
2	0 - 15
3	5 - 20
4	10 - 35
5	15 - 40
6	10 - 35
7	0 - 20
8	0 - 15

C. Polyacrylamide gel electrophoresis and immunoblotting

(a) Polyacrylamide gel electrophoresis (2.2.31)

Gel dimensions: 0.75 mm thick, about 16 cm square.

Resolving gel: 12 per cent acrylamide.

Sample buffer. SDS-PAGE sample buffer (concentrated) R.

Test solution (a). Dilute the preparation to be examined in *water R* to obtain a concentration of 1.0 mg/ml. To 1 volume of this solution add 1 volume of sample buffer.

Test solution (b). Dilute the preparation to be examined in *water R* to obtain a concentration of 0.1 mg/ml. To 1 volume of this solution add 1 volume of sample buffer.

Reference solution (a). Dissolve the contents of a vial of *erythropoietin BRP* in 0.25 ml of *water R*. To 1 volume of this solution add 1 volume of sample buffer.

Reference solution (b). Dissolve the contents of a vial of *erythropoietin BRP* in *water R* and dilute with the same solvent to obtain a concentration of 0.1 mg/ml. To 1 volume of this solution add 1 volume of sample buffer.

Reference solution (c). A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 10-70 kDa.

Reference solution (d). A solution of pre-stained molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 10-70 kDa and suitable for the electrotransfer to an appropriate membrane.

Sample treatment: boil for 2 min.

Application: 20 µl, in the following order: reference solution (c), reference solution (a), test solution (a), empty well, reference solution (b), test solution (b), reference solution (d).

At the end of the separation, remove the gel-cassette from the apparatus, and cut the gel into 2 parts: the first part containing reference solution (c), reference solution (a) and test solution (a); the second part containing reference solution (b), test solution (b) and reference solution (d).

Detection: Coomassie staining on the first part of the gel.

System suitability: reference solution (c).

Validation criteria are met.

Results: the electropherogram obtained with test solution (a) shows a single diffuse band corresponding in position and intensity to the single band seen in the electropherogram obtained with reference solution (a).

(b) Immunoblotting

Transfer the second part of the gel onto a membrane suitable for the immobilisation of proteins, using commercially available electrotransfer equipment and following the manufacturer's instructions. After electrotransfer, incubate the membrane in a neutral isotonic buffer containing a suitable blocking agent (for example, 50 g/l of dried milk or 10 per cent V/V foetal calf serum), for 1-2 h, followed by incubation for 1-14 h in the same blocking solution with a suitable dilution of either a polyclonal or monoclonal anti-erythropoietin antibody. Detect erythropoietin-bound antibody using a suitable enzyme- or radiolabelled antibody (for example, an alkaline phosphatase-conjugated second antibody). The precise details of blocking agents, concentrations and incubation times should be optimised using the principles set out in *Immunochemical methods* (2.7.1).

System suitability: in the electropherogram obtained with reference solution (d), the molecular mass markers are resolved on the membrane into discrete bands, with a linear relationship between distance migrated and $\log_{10}$ of the molecular mass.

Results: the electropherogram obtained with test solution (b) shows a single broad band corresponding in position and intensity to the single band seen in the electropherogram obtained with reference solution (b).

D. Peptide mapping

Test solution. Dilute the preparation to be examined in *tris-acetate buffer solution pH 8.5 R* to a concentration of 1.0 mg/ml. Equilibrate the solution in *tris-acetate buffer solution pH 8.5 R* using a suitable procedure (dialysis against *tris-acetate buffer solution pH 8.5 R*, or membrane filtration using the procedure described under Identification B, but reconstituting the desalted sample with *tris-acetate buffer solution pH 8.5 R*, are suitable). Transfer the dialysed solution to a polypropylene centrifuge tube. Freshly prepare a solution of *trypsin for peptide mapping R* at a concentration of 1 mg/ml in *water R*, and add 5 µl to 0.25 ml of the dialysed solution. Cap the tube and place in a water-bath at 37 °C for 18 h. Remove the sample from the water-bath and stop the reaction immediately by freezing.

Reference solution. Dissolve the contents of a vial of *erythropoietin BRP* in 0.25 ml of *water R*. Prepare as for the test solution, ensuring that all procedures are carried out simultaneously, and under identical conditions.

Examine the 2 tryptic digests by liquid chromatography (2.2.29).

Figure 1316.-1. – Ph. Eur. reference electropherogram of erythropoietin

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: butylsilyl silica gel R (5-10 μ m).

Mobile phase:

- mobile phase A: 0.06 per cent V/V solution of trifluoroacetic acid R,
- mobile phase B: to 100 ml of water R add 0.6 ml of trifluoroacetic acid R and dilute to 1000 ml with of acetonitrile for chromatography R,

Time (min)	Flow rate (ml/min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	0.75	100	0
10 - 125	0.75	100 $\rightarrow$ 39	0 $\rightarrow$ 61
125 - 135	1.25	39 $\rightarrow$ 17	61 $\rightarrow$ 83
135 - 145	1.25	17 $\rightarrow$ 0	83 $\rightarrow$ 100
145 - 150	1.25	100	0

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 μ l.

System suitability: the chromatogram obtained with each solution is qualitatively similar to the chromatogram of erythropoietin digest supplied with erythropoietin BRP.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

E. N-terminal sequence analysis

The first 15 amino acids are: Alanine - Proline - Proline - Arginine - Leucine - Isoleucine - (no recovered peak) - Aspartic acid - Serine - Arginine - Valine - Leucine - Glutamic acid - Arginine - Tyrosine.

Perform the Edman degradation using an automated solid-phase sequencer, operated in accordance with the manufacturer's instructions.

Desalt the equivalent of 50 μ g of erythropoietin. For example, dilute a volume of the substance to be examined equivalent to 50 μ g of the active substance in 1 ml of a 0.1 per cent V/V solution of trifluoroacetic acid R. Pre-wash a C18 reverse-phase sample preparation cartridge according to the instructions supplied and equilibrate the cartridge in a 0.1 per cent V/V solution of trifluoroacetic acid R. Apply the sample to the cartridge, and wash successively with a 0.1 per cent V/V solution of trifluoroacetic acid R containing 0 per cent, 10 per cent and 50 per cent V/V of acetonitrile R according to the manufacturer's instructions. Lyophilise the 50 per cent V/V acetonitrile R eluate.

Redissolve the desalted sample in 50 μ l of a 0.1 per cent V/V solution of trifluoroacetic acid R and couple to a sequencing cartridge using the protocol provided by the manufacturer. Run 15 sequencing cycles, using the reaction conditions for proline when running the second and third cycles.

Identify the phenylthiohydantoin (PTH)-amino acids released at each sequencing cycle by reverse-phase liquid chromatography. The procedure may be carried out using the column and reagents recommended by the manufacturer of the sequencing equipment for the separation of PTH-amino-acids.

The separation procedure is calibrated using:

- the mixture of PTH-amino acids provided by the manufacturer of the sequencer, with the gradient conditions adjusted as indicated to achieve optimum resolution of all amino acids,
- a sample obtained from a blank sequencing cycle obtained as recommended by the equipment manufacturer.

TESTS

Protein (2.5.33, *Method I*): 80 per cent to 120 per cent of the stated concentration.

Test solution. Dilute the preparation to be examined in a 4 g/l solution of *ammonium hydrogen carbonate R*.

Record the absorbance spectrum between 250 nm and 400 nm. Measure the value at the absorbance maximum (276–280 nm), after correction for any light scattering, measured up to 400 nm. Calculate the concentration of erythropoietin using a specific absorbance value of 7.43.

Dimers and related substances of higher molecular mass. Size-exclusion chromatography (2.2.30).

Test solution. Dilute the preparation to be examined in the mobile phase to obtain a concentration of 0.2 mg/ml.

Reference solution. To 0.02 ml of the test solution add 0.98 ml of the mobile phase.

Column:

- *size:* $l = 0.6$ m, $\varnothing = 7.5$ mm,
- *stationary phase:* *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the molecular mass range of 20 000 to 200 000.

Mobile phase: dissolve 1.15 g of *anhydrous disodium hydrogen phosphate R*, 0.2 g of *potassium dihydrogen phosphate R* and 23.4 g of *sodium chloride R* in 1 litre of *water R* (1.5 mM potassium dihydrogen phosphate, 8.1 mM disodium hydrogen phosphate, 0.4 M sodium chloride, pH 7.4); adjust the pH to 7.4 if necessary.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 100 µl.

Run time: minimum 1 h.

System suitability: the area of the principal peak in the chromatogram obtained with the reference solution is 1.5 to 2.5 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

Limit:

- *total of any peaks eluted before the principal peak:* not more than the area of the principal peak in the chromatogram obtained with the reference solution (2 per cent).

Sialic acids: minimum 10 mol of sialic acids (calculated as *N*-acetylneuraminic acid) per mole of erythropoietin.

Test solution (a). Dilute the preparation to be examined in the mobile phase used in the test for dimers and related substances of higher molecular mass to obtain a concentration of 0.3 mg/ml.

Test solution (b). To 0.5 ml of test solution (a) add 0.5 ml of the mobile phase used in the test for dimers and related substances of higher molecular mass.

Reference solution (a). Dissolve a suitable amount of *N*-acetylneuraminic acid *R* in *water R* to obtain a concentration of 0.1 mg/ml.

Reference solution (b). To 0.8 ml of reference solution (a) add 0.2 ml of *water R*.

Reference solution (c). To 0.6 ml of reference solution (a) add 0.4 ml of *water R*.

Reference solution (d). To 0.4 ml of reference solution (a) add 0.6 ml of *water R*.

Reference solution (e). To 0.2 ml of reference solution (a) add 0.8 ml of *water R*.

Reference solution (f). Use *water R*.

Carry out the test in triplicate. Transfer 100 µl of each of the test and reference solutions to 10 ml glass test tubes. To each tube add 1.0 ml of *resorcinol reagent R*. Stopper the tubes and incubate at 100 °C for 30 min. Cool on ice. To each tube, add 2.0 ml of a mixture of 12 volumes of *butanol R* and 48 volumes of *butyl acetate R*. Mix vigorously, and allow the 2 phases to separate. Ensuring that the upper phase is completely clear, remove the upper phase, taking care to exclude completely any of the lower phase. Measure the absorbance (2.2.25) of all samples at 580 nm. Using the calibration curve generated by the reference solutions, determine the content of sialic acids in each of the 2 test solutions and calculate the mean. Calculate the number of moles of sialic acids per mole of erythropoietin assuming that the relative molecular mass of erythropoietin is 30 600 and that the relative molecular mass of *N*-acetylneuraminic acid is 309.

System suitability:

- the individual replicates agree to within ± 10 per cent of each other,
- the value obtained from reference solution (a) is between 1.5 and 2.5 times that obtained with test solution (a).

Bacterial endotoxins (2.6.14): less than 20 IU in the volume that contains 100 000 IU of erythropoietin.

ASSAY

The activity of the preparation is compared with that of *erythropoietin BRP* and expressed in International Units (IU).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits of the estimated potency ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

Carry out the determination of potency by Method A or B.

A. In polycythaemic mice

The activity of the preparation is estimated by examining, under given conditions, its effect in stimulating the incorporation of ^{59}Fe into circulating red blood cells of mice made polycythaemic by exposure to reduced atmospheric pressure.

The following schedule, using treatment in a hypobaric chamber, has been found to be suitable.

Induce polycythaemia in female mice of the same strain, weighing 16 g to 18 g. Place the mice in a hypoxic chamber and reduce the pressure to 0.6 atmospheres. After 3 days at 0.6 atmospheres, further reduce the pressure to 0.4–0.5 atmospheres and maintain the animals at this pressure for a further 11 days (the partial vacuum is interrupted daily for a maximum of 1 h at about 11:00 a.m., in order to clean the cages and feed the animals). At the end of the specified period, return the mice to normal atmospheric conditions. Randomly distribute the mice into cages, each containing 6 animals, and mark them.

Test solution (a). Dilute the substance to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/ml.

Test solution (b). Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Test solution (c). Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (a). Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/ml.

Reference solution (b). Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (c). Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Radiolabelled ferric [⁵⁹Fe] chloride solution, concentrated. Use a commercially available solution of [⁵⁹Fe]ferric chloride (approximate specific activity: 100-1000 MBq/mg of Fe).

Radiolabelled [⁵⁹Fe]ferric chloride solution. Dilute the concentrated radiolabelled [⁵⁹Fe]ferric chloride solution in *sodium citrate buffer solution pH 7.8 R* to obtain a solution with an activity of 3.7×10^4 Bq/ml.

The concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

3 days after returning the animals to atmospheric pressure, inject each animal subcutaneously with 0.2 ml of one of the solutions. The 6 animals in each cage must each receive one of the 6 different treatments (3 test solutions and 3 reference solutions), and the order of injection must be separately randomised for each cage. A minimum of 8 cages is recommended. 2 days after injection of the test or reference solution, inject each animal intraperitoneally with 0.2 ml of radiolabelled [⁵⁹Fe]ferric chloride solution. The order of the injections must be the same as that of the erythropoietin injections, and the time interval between administration of the erythropoietin and the radiolabelled ferric chloride solution must be the same for each animal. After a further 48 h, anaesthetise each animal by injection of a suitable anaesthetic, record body weights and withdraw blood samples (0.65 ml) into haematocrit capillaries from the bifurcation of the aorta. After determining the packed cell volume for each sample, measure the radioactivity.

Calculate the response (percentage of iron-59 in total circulating blood) for each mouse using the expression:

$$\frac{A_s \times M \times 7.5}{A_t \times V_s}$$

- A_s = radioactivity in the sample,
 A_t = total radioactivity injected,
 7.5 = total blood volume as per cent body weight,
 M = body weight, in grams,
 V_s = sample volume.

Calculate the potency by the usual statistical methods for a parallel line assay. Eliminate from the calculation any animal where the packed cell volume is less than 54 per cent, or where the body weight is more than 24 g.

B. In normocythaemic mice

The assay is based on the measurement of stimulation of reticulocyte production in normocythaemic mice.

The assay may be carried out using the following procedure:

Test solution (a). Dilute the substance to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/ml.

Test solution (b). Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Test solution (c). Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (a). Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/ml.

Reference solution (b). Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (c). Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

The exact concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

At the beginning of the assay procedure, randomly distribute mice of a suitable age and strain (8-week old B6D2F1 mice are suitable) into 6 cages. A minimum of 8 mice per cage is recommended. Inject each animal subcutaneously with 0.5 ml of the appropriate treatment (one solution per cage) and put the animal in a new cage. Combine the mice in such a way that each cage housing the treated mice contains one mouse out of the 6 different treatments (3 test solutions and 3 reference solutions, 6 mice per cage). 4 days after the injections, collect blood samples from the animals and determine the number of reticulocytes using a suitable procedure.

The following method may be employed:

The volume of blood, dilution procedure and fluorescent reagent may need to be modified to ensure maximum development and stability of fluorescence.

Colorant solution, concentrated. Use a solution of thiazole orange suitable for the determination of reticulocytes. Prepare at a concentration twice that necessary for the analysis.

Proceed with the following dilution steps. Dilute whole blood 500-fold in the buffer used to prepare the colorant solution. Dilute this solution 2-fold in the concentrated colorant solution. After staining for 3-10 min, determine the reticulocyte count microfluorometrically in a flow cytometer. The percentage of reticulocytes is determined using a biparametric histogram: number of cells/red fluorescence (620 nm).

Calculate the potency by the usual statistical methods for a parallel line assay.

STORAGE

In an airtight container at a temperature below -20°C . Avoid repeated freezing and thawing.

LABELLING

The label states:

- the erythropoietin content in milligrams per millilitre,
- the activity in International Units per millilitre,
- the name and the concentration of any other excipients.

01/2005:1742 Column:

ESKETAMINE HYDROCHLORIDE

Esketamini hydrochloridum

 $C_{13}H_{17}Cl_2NO$ M_r 274.2**DEFINITION**

(2S)-2-(2-Chlorophenyl)-2-(methylamino)cyclohexanone hydrochloride.

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS*Appearance*: white, crystalline powder.*Solubility*: freely soluble in water and in methanol, soluble in alcohol.**IDENTIFICATION**

A. Specific optical rotation (2.2.7): + 85.0 to + 95.0.

Dilute 12.5 ml of solution S (see Tests) to 40.0 ml with water R.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of esketamine hydrochloride.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS**Solution S.** Dissolve 8.0 g in carbon dioxide-free water R and dilute to 50.0 ml with the same solvent.**Appearance of solution.** Solution S is clear (2.2.1) and colourless (2.2.2, Method II).**pH** (2.2.3): 3.5 to 4.5.

Dilute 12.5 ml of solution S to 20 ml with carbon dioxide-free water R.

Impurity D. Liquid chromatography (2.2.29).*Test solution.* Dissolve 25.0 mg of the substance to be examined in water R and dilute to 100.0 ml with the same solvent.*Reference solution (a).* Dissolve 5 mg of esketamine impurity D CRS in water R, add 20 ml of the test solution and dilute to 50 ml with water R. Dilute 10 ml of this solution to 100 ml with water R.*Reference solution (b).* Dilute 5.0 ml of the test solution to 25.0 ml with water R. Dilute 5.0 ml of this solution to 50.0 ml with water R.*Reference solution (c).* Dilute 2.5 ml of reference solution (b) to 10.0 ml with water R. Dilute 1.0 ml of this solution to 10.0 ml with water R.*Precolumn*:

- size: $l = 0.01$ m, $\emptyset = 3.0$ mm,
- stationary phase: silica gel AGP for chiral chromatography R (5 μ m),
- temperature: 30 °C.

- size: $l = 0.125$ m, $\emptyset = 4.6$ mm,
- stationary phase: silica gel AGP for chiral chromatography R (5 μ m),
- temperature: 30 °C.

Mobile phase: mix 16 volumes of methanol R and 84 volumes of a 6.8 g/l solution of potassium dihydrogen phosphate R previously adjusted to pH 7.0 with potassium hydroxide R.*Flow rate*: 0.8 ml/min.*Detection*: spectrophotometer at 215 nm.*Injection*: 20 μ l.*Run time*: 20 min.*Relative retention* with reference to esketamine (retention time = about 10 min): impurity D = about 1.3.*System suitability*:

- resolution: minimum 2.0 between the peaks due to esketamine and impurity D in the chromatogram obtained with reference solution (a),
- signal-to-noise ratio: minimum 3 for the principal peak in the chromatogram obtained with reference solution (c).

Limit:

- impurity D: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Related substances. Liquid chromatography (2.2.29).*Test solution.* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.*Reference solution (a).* Dissolve 5 mg of ketamine impurity A CRS in the mobile phase (using ultrasound, if necessary) and dilute to 10 ml with the mobile phase. To 1 ml of the solution add 0.5 ml of the test solution and dilute to 100 ml with the mobile phase. Prepare immediately before use.*Reference solution (b).* Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.*Column*:

- size: $l = 0.125$ m, $\emptyset = 4.0$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: dissolve 0.95 g of sodium hexanesulphonate R in 1000 ml of a mixture of 25 volumes of acetonitrile R and 75 volumes of water R and add 4 ml of acetic acid R.*Flow rate*: 1.0 ml/min.*Detection*: spectrophotometer at 215 nm.*Injection*: 20 μ l.*Run time*: 10 times the retention time of esketamine.*Relative retention* with reference to esketamine: impurity A = about 1.6; impurity B = about 3.3; impurity C = about 4.6.*System suitability*: reference solution (a):

- retention time: esketamine = 3.0 min to 4.5 min,
- resolution: minimum 1.5 between the peaks due to impurity A and esketamine.

Limits:

- impurities A, B, C: for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

01/2005:0139

ESTRADIOL BENZOATE

Estradioli benzoas

 $C_{25}H_{28}O_3$ M_r 376.5

DEFINITION

17 β -Hydroxyestra-1,3,5(10)-trien-3-yl benzoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: almost white, crystalline powder or colourless crystals.**Solubility:** practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, slightly soluble in methanol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: estradiol benzoate CRS.If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Specific optical rotation (2.2.7): + 55.0 to + 59.0 (dried substance).Dissolve 0.250 g in *acetone R* and dilute to 25.0 ml with the same solvent.**Related substances.** Liquid chromatography (2.2.29).**Test solution.** Dissolve 20 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.**Reference solution (a).** Dissolve 5 mg of *estradiol benzoate impurity E CRS* in 5 ml of *acetonitrile R*, add 2.5 ml of the test solution and dilute to 10 ml with *acetonitrile R*.**Reference solution (b).** Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.**Column:**

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase:

- mobile phase A: *water R*, *acetonitrile R* (40:60 V/V),
- mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - t_R	100	0
$t_R - (t_R + 1)$	100 $\rightarrow$ 10	0 $\rightarrow$ 90
$(t_R + 1) - (t_R + 10)$	10	90

 t_R = retention time of impurity E

- **any other impurity:** for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.4.8): maximum 20 ppm.Dilute 12.5 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *methanol R* and add 1.0 ml of 0.1 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.42 mg of $C_{13}H_{17}Cl_2NO$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. X = N-CH₃: 1-[(2-chlorophenyl)(methylimino)methyl]cyclopentanol,

C. X = O: (2-chlorophenyl)(1-hydroxycyclopentyl)methanone,

B. (2*RS*)-2-(2-chlorophenyl)-2-hydroxycyclohexanone,D. (2*R*)-2-(2-chlorophenyl)-2-(methylamino)cyclohexanone ((*R*)-ketamine).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl.

Elution order: impurity A, impurity F, estradiol benzoate, impurity E, impurity B, impurity D, impurity C.

Relative retention with reference to estradiol benzoate: impurity C = about 1.5.

System suitability: reference solution (a):

- resolution: minimum 2.0 between the peaks due to estradiol benzoate and impurity E.

Limits:

- correction factor: for the calculation of content, multiply the peak area of impurity C by 0.7,
- any impurity: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- total: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- disregard limit: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 0.5 g by drying in an oven at 100–105 °C for 3 h.

ASSAY

Dissolve 25.0 mg in *anhydrous ethanol R* and dilute to 250.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *anhydrous ethanol R*. Measure the absorbance (2.2.25) at the absorption maximum at 231 nm.

Calculate the content of $C_{25}H_{28}O_3$ taking the specific absorbance to be 500.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

- A. $R_1 = R_2 = R_3 = H, R_4 = OH$: estradiol,
 B. $R_1 = CO-C_6H_5, R_2 = CH_3, R_3 = H, R_4 = OH$:
 17β-hydroxy-4-methylestra-1,3,5(10)-trien-3-yl benzoate,
 C. $R_1 = CO-C_6H_5, R_2 = R_3 = H, R_4 = O-CO-C_6H_5$:
 estra-1,3,5(10)-triene-3,17β-diyl dibenzoate,
 D. $R_1 = R_2 = R_3 = H, R_4 = O-CO-C_6H_5$: 3-hydroxyestra-1,3,
 5(10)-trien-17β-yl benzoate,
 E. $R_1 = CO-C_6H_5, R_2 = R_4 = H, R_3 = OH$:
 17α-hydroxyestra-1,3,5(10)-trien-3-yl benzoate,

- F. 17β-hydroxyestra-1,3,5(10),9(11)-tetraen-3-yl benzoate.

ESTRADIOL HEMIHYDRATE

Estradiolum hemihydricum

$C_{18}H_{24}O_2 \cdot \frac{1}{2}H_2O$

M_r 281.4

DEFINITION

Estra-1,3,5(10)-triene-3,17β-diol hemihydrate.

Content: 97.0 per cent to 103.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, soluble in acetone, sparingly soluble in alcohol, slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 175 °C to 180 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: estradiol hemihydrate CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *estradiol hemihydrate CRS* in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *ethinylestradiol CRS* in reference solution (a) and dilute to 25 ml with reference solution (a).

Plate: TLC silica gel plate R.

Mobile phase: alcohol R, toluene R (20:80 V/V).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: in air until the solvent has evaporated.

Detection: heat at 110 °C for 10 min. Spray the hot plate with *alcoholic solution of sulphuric acid R*. Heat again at 110 °C for 10 min. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 spots which may however not be completely separated.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a).

- D. To about 1 mg add 0.5 ml of freshly prepared *sulphomolybdic reagent R2*. A blue colour develops which in ultraviolet light at 365 nm has an intense green

fluorescence. Add 1 ml of *sulphuric acid R* and 9 ml of *water R*. The colour becomes pink with a yellowish fluorescence.

E. It complies with the test for water (see Tests).

TESTS

Specific optical rotation (2.2.7): + 76.0 to + 83.0 (anhydrous substance).

Dissolve 0.250 g in *alcohol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 10 ml of *acetonitrile R* and dilute to 25.0 ml with *methanol R2*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of *17 α -estradiol R* in 5.0 ml of *acetonitrile R*. Mix 2.0 ml of this solution with 1.0 ml of the test solution and dilute to 5.0 ml with the mobile phase.

Reference solution (c). Mix equal volumes of a 1 mg/ml solution of the substance to be examined in *methanol R2* and of a 1 mg/ml solution of *2,3-dichloro-5,6-dicyanobenzoquinone R* in *methanol R2*. Allow to stand for 30 min before injection.

Reference solution (d). Dissolve 5 mg of *estradiol for peak identification CRS* (estradiol hemihydrate spiked with impurities A, B and C at about 0.5 per cent) in 2 ml of *acetonitrile R* and dilute to 5 ml with *methanol R2*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: to 400 ml of *acetonitrile R* add 50 ml of *methanol R2* and 400 ml of *water R*; allow to stand for 10 min, dilute to 1000 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Equilibration: about 60 min.

Injection: 20 μ l.

Run time: twice the retention time of the principal peak.

Relative retention with reference to estradiol (retention time = about 13 min): impurity D = about 0.9; impurity B = about 1.1; impurity A = about 1.4; impurity C = about 1.9.

System suitability: reference solution (b):

- resolution: minimum 2.5 between the peaks due to estradiol and impurity B.

Limits:

- correction factor: for the calculation of content, multiply the peak area of impurity D by 0.4 (use the chromatogram obtained with reference solution (c) to identify this peak),
- impurities A, B, C, D: for each impurity, not more than 1.5 times the area of the principal peak obtained with reference solution (a) (0.3 per cent),
- any other impurity: for each impurity, not more than 0.5 times the area of the principal peak obtained with reference solution (a) (0.1 per cent),

- total: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): 2.9 per cent to 3.5 per cent, determined on 0.500 g.

ASSAY

Dissolve 20.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with 0.1 M sodium hydroxide. Allow to cool to room temperature. Measure the absorbance (2.2.25) of the solution at the maximum at 238 nm.

Calculate the content of $C_{18}H_{24}O_2$ taking the specific absorbance to be 335.

IMPURITIES

Specified impurities: A, B, C, D.

- A. $R_1 = H$, $R_2 + R_3 = O$: 3-hydroxyestra-1,3,5(10)-trien-17-one (estrone),
- B. $R_1 = R_3 = H$, $R_2 = OH$: estra-1,3,5(10)-triene-3,17 α -diol (17 α -estradiol),
- C. $R_1 = CH_3$, $R_2 = H$, $R_3 = OH$: 4-methylestra-1,3,5(10)-triene-3,17 β -diol,

- D. estra-1,3,5(10),9(11)-tetraene-3,17 β -diol.

01/2005:1614

ESTRADIOL VALERATE

Estradioli valeras

$C_{23}H_{32}O_3$

M_r 356.5

DEFINITION

3-Hydroxyestra-1,3,5(10)-trien-17 β -yl pentanoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, soluble in alcohol. mp: about 145 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: estradiol valerate CRS.

TESTS

Solution S. Dissolve 0.500 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7): + 41 to + 47 (dried substance), determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Solvent mixture. Mix 15 volumes of *water R* and 135 volumes of *acetonitrile R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *estradiol valerate CRS* and 2 mg of *estradiol butyrate CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 μ m),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: *water R*,
- mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	40 $\rightarrow$ 0	60 $\rightarrow$ 100
15 - 25	0	100
25 - 30	40	60
30 = 0	40	60

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 μ l.

Relative retention with reference to estradiol valerate (retention time = about 12 min): impurity F = about 0.9.

System suitability: reference solution (a):

- resolution: minimum of 5.0 between the peaks due to impurity F and to estradiol valerate.

Limits:

- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- total: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 25.0 mg in *alcohol R* and dilute to 250.0 ml with the same solvent. Measure the absorbance (2.2.25) at the maximum at 280 nm.

Calculate the content of $C_{23}H_{32}O_3$ taking the specific absorbance to be 58.0.

STORAGE

Protected from light.

IMPURITIES

- A. $R_1 = R_2 = R_3 = H$: estradiol,
 B. $R_1 = CO-[CH_2]_3-CH_3$, $R_2 = R_3 = H$: 17 β -hydroxyestra-1,3,5(10)-trien-3-yl pentanoate,
 D. $R_1 = H$, $R_2 = CH_3$, $R_3 = CO-[CH_2]_3-CH_3$: 3-hydroxy-4-methylestra-1,3,5(10)-trien-17 β -yl pentanoate,
 E. $R_1 = R_3 = CO-[CH_2]_3-CH_3$, $R_2 = H$: estra-1,3,5(10)-trien-3,17 β -diyl dipentanoate,
 F. $R_1 = R_2 = H$, $R_3 = CO-[CH_2]_2-CH_3$: 3-hydroxyestra-1,3,5(10)-trien-17 β -yl butanoate (estradiol butyrate),

- C. 3-hydroxyestra-1,3,5(10),9(11)-tetraen-17 β -yl pentanoate.

01/2005:1203

ESTRIOL

Estriolum

$C_{18}H_{24}O_3$

M_r 288.4

DEFINITION

Estriol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of estra-1,3,5(10)-triene-3,16 α ,17 β -triol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in alcohol.

It melts about 282 °C.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *estriol CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *estriol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *estradiol hemihydrate CRS* in reference solution (a) and dilute to 5 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *alcohol R* and 80 volumes of *toluene R*. Allow the plate to dry in air. Spray the plate with *alcoholic solution of sulphuric acid R*. Heat the plate at 100 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

TESTS

Specific optical rotation (2.2.7). Dissolve 80 mg in *ethanol R* and dilute to 10 ml with the same solvent. The specific optical rotation is + 60 to + 65, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Solvent mixture. A mixture of 20 volumes of *2-propanol R1* and 80 volumes of *heptane R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in 5 ml of *2-propanol R1* and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of *estriol CRS* and 2.0 mg of *estriol impurity A CRS* in 5 ml of *2-propanol R1* and dilute to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.0 mm in internal diameter packed with *diol silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1.2 ml/min a linear gradient programme using the following conditions:

Mobile phase A. Heptane R,

Mobile phase B. 2-Propanol R1,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	95 → 88	5 → 12	linear gradient
10 - 20	88	12	isocratic
20 - 30	88 → 95	12 → 5	switch to initial eluent composition
30 - 35	95	5	equilibration
35 = 0	95	5	restart gradient

- as detector a spectrophotometer set at 280 nm, maintaining the temperature of the column at 40 °C.

Equilibrate the column with a mixture of 20 per cent V/V of *2-propanol R1* in *heptane R* until a stable baseline is obtained.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is about 25 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: estriol about 19 min and estriol impurity A about 21 min. The test is not valid unless the resolution between the peaks corresponding to estriol and estriol impurity A is at least 2.2. If the retention times increase or the resolution decreases, wash the column first with *acetone R* and then with *heptane R*.

Inject separately 20 µl of the solvent mixture as a blank, 20 µl of the test solution and 20 µl of each of the reference solutions (a) and (b). In the chromatogram obtained with the test solution: the area of any peak corresponding to estriol impurity A is not greater than half the area of the peak corresponding to estriol impurity A in the chromatogram obtained with reference solution (a) (0.5 per cent) and any other peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak and the peak corresponding to estriol impurity A, is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak due to the blank and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 25.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 10.0 ml of this solution to 50.0 ml with the same solvent. Measure the absorbance (2.2.25) at the maximum at 281 nm.

Calculate the content of C₁₈H₂₄O₃ taking the specific absorbance to be 72.5.

IMPURITIES

01/2005:1512

Specified impurities: A, B, C, D, E, F, G.

Other detectable impurities: H, I.

A. estra-1,3,5(10),9(11)-tetraene-3,16α,17β-triol (9,11-didehydroestradiol),

B. 3-hydroxyestra-1,3,5(10)-trien-17-one (estrone),

C. 3-methoxyestra-1,3,5(10)-triene-16α,17β-diol (estriol 3-methyl ether),

D. R1 = R2 = R3 = H, R4 = OH: estradiol,

E. R1 = R3 = OH, R2 = R4 = H: estra-1,3,5(10)-triene-3,16α,17α-triol (17-epi-estriol),

F. R1 = R3 = H, R2 = R4 = OH: estra-1,3,5(10)-triene-3,16β,17β-triol (16-epi-estriol),

G. R1 = R4 = H, R2 = R3 = OH: estra-1,3,5(10)-triene-3,16β,17α-triol (16,17-epi-estriol),

H. R1 = OH, R2 = H, R3 + R4 = O: 3,16α-dihydroxyestra-1,3,5(10)-trien-17-one,

I. 3-hydroxy-17-oxa-D-homoestra-1,3,5(10)-trien-17a-one.

ESTROGENS, CONJUGATED

Estrogeni coniuncti

 $C_{18}H_{21}O_5NaS + C_{18}H_{19}O_5NaS$ $M_r 372.4 + 370.4$

DEFINITION

Conjugated estrogens are a mixture of various conjugated forms of estrogens obtained from the urine of pregnant mares or by synthesis, dispersed in a suitable powdered diluent.

The two principal components are 17-oxoestra-1,3,5(10)-trien-3-yl sodium sulphate (sodium estrone sulphate) and 17-oxoestra-1,3,5(10),7-tetraen-3-yl sodium sulphate (sodium equilin sulphate). Concomitants are sodium 17α-estradiol sulphate, sodium 17α-dihydroequilin sulphate and sodium 17β-dihydroequilin sulphate.

Conjugated estrogens contain not less than 52.5 per cent and not more than 61.5 per cent of sodium estrone sulphate, not less than 22.5 per cent and not more than 30.5 per cent of sodium equilin sulphate, not less than 2.5 per cent and not more than 9.5 per cent of sodium 17α-estradiol sulphate, not less than 13.5 per cent and not more than 19.5 per cent of sodium 17α-dihydroequilin sulphate, not less than 0.5 per cent and not more than 4.0 per cent of sodium 17β-dihydroequilin sulphate. The total of sodium estrone sulphate and sodium equilin sulphate is not less than 79.5 per cent and not more than 88.0 per cent.

All percentages are related to the labelled content.

CHARACTERS

An almost white or brownish, amorphous powder.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

The retention times and sizes of the 2 principal peaks corresponding to estrone and equilin in the chromatogram obtained with test solution (a) are approximately the same as those of the 2 principal peaks in the chromatogram obtained with reference solution (a).

B. Examine the chromatogram obtained with test solution (b) in the chromatographic profile. The chromatogram exhibits additional peaks corresponding to 17α-estradiol, 17α-dihydroequilin and 17β-dihydroequilin, at relative retentions with reference to 3-O-methylestrone (internal standard) of about 0.24, 0.30 and 0.35 respectively.

TESTS

Chromatographic profile. Carry out the test as prescribed in the assay with the following additional information.

Test solution (b). Prepare the test solution as described in the assay, do not add the sulphatase and use 6.0 ml of the upper layer instead of 3.0 ml. Prepare a blank in the same manner.

Reference solution (b). Prepare the reference solution as described in the assay. Dilute tenfold with *ethanol R* before adding the internal standard.

Inject 1 µl of reference solution (a). Measure the areas of the peaks due to 17α-dihydroequilin, estrone and 3-O-methylestrone, with relative retentions with reference to 3-O-methylestrone of about 0.30, 0.80 and 1 respectively.

Inject 1 µl of test solution (a). Locate the peaks with relative retentions with reference to 3-O-methylestrone of 1 and about 0.24, 0.29, 0.30, 0.35, 0.56, 0.64, 0.90 and 1.3 and measure their areas.

Calculate the percentage content of the components occurring as sodium sulphate salts using expression (1) below.

Inject 1 µl of reference solution (b). Measure the areas of the peaks due to estrone and 3-O-methylestrone, with relative retentions with reference to 3-O-methylestrone of about 0.80 and 1 respectively.

Inject 1 µl of test solution (b). Locate the peaks with relative retentions with reference to 3-O-methylestrone of about 0.30, 0.80 and 0.87 and measure the sum of the areas.

Calculate the percentage content of 17α-dihydroequilin, estrone and equilin occurring as free steroids using expression (2):

$$\frac{S'_A \times S_I \times m_R \times 137.8 \times 1000}{S_R \times S'_I \times m \times LC} \quad (1)$$

$$\frac{S'_{FS} \times S_I \times m_E \times 100 \times 1000}{S_E \times S'_I \times m \times LC} \quad (2)$$

S_I = area of the peak due to the internal standard in the chromatogram obtained with the corresponding reference solution,

S'_I = area of the peak due to the internal standard in the chromatogram obtained with the corresponding test solution,

S_R = area of the peak due to the reference substance (Table 1512.-1) in the chromatogram obtained with the corresponding reference solution,

S'_A = area of the peak due to the analyte in the chromatogram obtained with the corresponding test solution,

m_R = mass of the reference substance (Table 1512.-1) in the corresponding reference solution, in milligrams,

m = mass of the substance to be examined in the corresponding test solution, in milligrams,

S'_{FS} = sum of the areas of the peaks due to 17α-dihydroequilin, estrone and equilin in the chromatogram obtained with the corresponding test solution,

S_E = area of the peak due to *estrone CRS* in the chromatogram obtained with the corresponding reference solution,

m_E = mass of *estrone CRS* in the corresponding reference solution, in milligrams,

LC = labelled content, in milligrams per gram.

The percentages are within the following ranges:

- *sodium 17α-estradiol sulphate*: 2.5 to 9.5 per cent,
- *sodium 17α-dihydroequilin sulphate*: 13.5 to 19.5 per cent,
- *sodium 17β-dihydroequilin sulphate*: 0.5 to 4.0 per cent,
- *sodium 17β-estradiol sulphate*: not more than 2.25 per cent,
- *sodium 17α-dihydroequilenin sulphate*: not more than 3.25 per cent,
- *sodium 17β-dihydroequilenin sulphate*: not more than 2.75 per cent,
- *sodium 8,9-didehydroestrone sulphate*: not more than 6.25 per cent,
- *sodium equilenin sulphate*: not more than 5.5 per cent,
- *total estrone, equilin and 17α-dihydroequilin*: not more than 1.3 per cent.

ASSAY

Examine by gas chromatography (2.2.28), using *3-O-methylestrone R* as the internal standard.

Internal standard solution. Dissolve 8 mg of *3-O-methylestrone R* in 10.0 ml of *ethanol R*. Dilute 2.0 ml of this solution to 10.0 ml with *ethanol R*.

Acetate buffer solution pH 5.2. Dissolve 10 g of *sodium acetate R* in 100 ml of *water R* and add 10 ml of *dilute acetic acid R*. Dilute with *water R* to 500 ml and adjust to pH 5.2 ± 0.1.

Test solution (a). Considering the labelled content, transfer an accurately weighed quantity corresponding to about 2 mg of conjugated estrogens to a 50 ml centrifuge tube containing 15 ml of acetate buffer solution pH 5.2 and 1 g of *barium chloride R*. Cap the tube tightly and shake for 30 min. If necessary, adjust the pH of the solution to

Table 1512.-1

Relative retention (to 3-O-methylestrone)	Analyte	Quantified with reference to CRS	Present as
0.24	17α-estradiol	17α-dihydroequilin CRS	sodium sulphate
0.29	17β-estradiol	estrone CRS	sodium sulphate
0.30	17α-dihydroequilin	17α-dihydroequilin CRS	free steroid, sodium sulphate (assay)
0.35	17β-dihydroequilin	17α-dihydroequilin CRS	sodium sulphate
0.56	17α-dihydroequilenin	estrone CRS	sodium sulphate
0.64	17β-dihydroequilenin	estrone CRS	sodium sulphate
0.80	estrone	estrone CRS	free steroid, sodium sulphate (assay)
0.87	equilin	equilin CRS	free steroid, sodium sulphate (assay)
0.90	8,9-didehydroestrone	estrone CRS	sodium sulphate
1	3-O-methylestrone	(internal standard)	
1.3	equilenin	estrone CRS	sodium sulphate

5.0 ± 0.5 with *acetic acid R* or a 120 g/l solution of *sodium acetate R*. Sonicate for 30 s, then shake for 30 min. Add a suitable sulphatase preparation equivalent to 2500 units and shake mechanically for 10 min in a water-bath at 50 ± 1 °C. Swirl the tube by hand, then shake mechanically for 10 min in the water-bath. Allow to cool. Add 15.0 ml of *ethylene chloride R* to the mixture, immediately cap the tube tightly and shake for 15 min. Centrifuge for 10 min or until the lower layer is clear. Draw out the organic layer to a screw cap tube and add 5 g of *anhydrous sodium sulphate R* and shake. Allow the solution to stand until clear. Protect the solution from any loss due to evaporation. Transfer 3.0 ml of the clear solution to a suitable centrifuge tube fitted with a screw cap. Add 1.0 ml of the internal standard solution. Evaporate the mixture to dryness with the aid of a stream of *nitrogen R* maintaining the temperature below 50 °C. To the dry residue add 15 µl of *anhydrous pyridine R* and 65 µl of *N,O-bis(trimethylsilyl)trifluoroacetamide R* containing 1 per cent *chlorotrimethylsilane R*. Immediately cap the tube tightly, mix thoroughly and allow to stand for 15 min. Add 0.5 ml of *toluene R* and mix mechanically.

Reference solution (a). Dissolve separately 8 mg of *estrone CRS*, 7 mg of *equilin CRS* and 5 mg of *17α-dihydroequilin CRS* in 10.0 ml of *ethanol R*. Dilute together 2.0 ml, 1.0 ml and 1.0 ml respectively of these solutions to 10.0 ml with *ethanol R*. Transfer 1.0 ml of this solution and 1.0 ml of the internal standard solution to a centrifuge tube fitted with a screw-cap. Evaporate the mixture to dryness with the aid of a stream of *nitrogen R*, maintaining the temperature below 50 °C. To the dry residue add 15 µl of *anhydrous pyridine R* and 65 µl of *N,O-bis(trimethylsilyl)trifluoroacetamide R* containing 1 per cent *chlorotrimethylsilane R*. Immediately cap the tube tightly, mix and allow to stand for 15 min. Add 0.5 ml of *toluene R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 15 m long and 0.25 mm in internal diameter coated with *poly[(cyanopropyl)(methyl)](phenyl)(methyl)siloxane R* (film thickness 0.25 µm),
- *hydrogen for chromatography R* as the carrier gas at a flow rate of 2 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:20 to 1:30,

maintaining the temperature of the column at 220 °C and that of the injection port and of the detector at 260 °C. Set the temperature and the flow rate of the carrier gas in such a manner that the required resolution is achieved.

Inject 1 µl of reference solution (a). The relative retentions with reference to 3-*O*-methylestrone are about 0.30, 0.80, 0.87, and 1 for 17α-dihydroequilin, estrone, equilin and 3-*O*-methylestrone, respectively.

The test is not valid unless the resolution between estrone and equilin is at least 1.2. The relative standard deviation of the ratio of the peak area due to estrone to that of the internal standard, obtained from at least 6 injections, is not more than 2.0 per cent.

Inject 1 µl of reference solution (a). Measure the areas of the peaks due to estrone or equilin and *O*-methylestrone. Inject 1 µl of test solution (a). Measure the areas of the peaks due to estrone, equilin and 3-*O*-methylestrone.

Calculate the percentage content of sodium estrone sulphate and sodium equilin sulphate using expression (1).

LABELLING

The label states:

- the name of the substance,

- the content of the substance,
- the nature of the diluent.

IMPURITIES AND CONCOMITANTS

- A. R1 = OH, R2 = H, R3 = SO₃Na: 17α-hydroxyestra-1,3,5(10)-trien-3-yl sodium sulphate (sodium 17α-estradiol sulphate),
- D. R1 = H, R2 = OH, R3 = SO₃Na: 17β-hydroxyestra-1,3,5(10)-trien-3-yl sodium sulphate (sodium 17β-estradiol sulphate),
- I. R1 + R2 = O, R3 = H: 3-hydroxyestra-1,3,5(10)-trien-17-one (estrone),

- B. R1 = OH, R2 = H, R3 = SO₃Na: 17α-hydroxyestra-1,3,5(10),7-tetraen-3-yl sodium sulphate (sodium 17α-dihydroequilin sulphate),
- C. R1 = H, R2 = OH, R3 = SO₃Na: 17β-hydroxyestra-1,3,5(10),7-tetraen-3-yl sodium sulphate (sodium 17β-dihydroequilin sulphate),
- J. R1 + R2 = O, R3 = H: 3-hydroxyestra-1,3,5(10),7-tetraen-17-one (equilin),
- K. R1 = OH, R2 = R3 = H: estra-1,3,5(10),7-tetraene-3,17α-diol (17α-dihydroequilin),

- E. R1 = OH, R2 = H: 17α-hydroxyestra-1,3,5(10),6,8-pentaen-3-yl sodium sulphate (sodium 17α-dihydroequilenin sulphate),
- F. R1 = H, R2 = OH: 17β-hydroxyestra-1,3,5(10),6,8-pentaen-3-yl sodium sulphate (sodium 17β-dihydroequilenin sulphate),
- H. R1 + R2 = O: 17-oxoestra-1,3,5(10),6,8-pentaen-3-yl sodium sulphate (sodium equilenin sulphate),

- G. 17-oxoestra-1,3,5(10),8-tetraen-3-yl sodium sulphate (sodium 8,9-didehydroestrone sulphate).

01/2005:0457 *Mobile phase: glacial acetic acid R, ethyl acetate R, methylene chloride R (20:50:60 V/V/V).*

ETACRYNIC ACID

Acidum etacrynicum

$C_{13}H_{12}Cl_2O_4$

M_r 303.1

DEFINITION

[2,3-Dichloro-4-(2-ethylpropenoyl)phenoxy]acetic acid.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in alcohol. It dissolves in ammonia and in dilute solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 121 °C to 124 °C.

B. Dissolve 50.0 mg in a mixture of 1 volume of a 103 g/l solution of *hydrochloric acid R* and 99 volumes of *methanol R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 10.0 ml of this solution to 100.0 ml with a mixture of 1 volume of a 103 g/l solution of *hydrochloric acid R* and 99 volumes of *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 270 nm and a shoulder at about 285 nm. The specific absorbance at the maximum at 270 nm is 110 to 120.

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *etacrynic acid CRS*.

D. Dissolve about 30 mg in 2 ml of *aldehyde-free alcohol R*. Dissolve 70 mg of *hydroxylamine hydrochloride R* in 0.1 ml of *water R*, add 7 ml of *alcoholic potassium hydroxide solution R* and dilute to 10 ml with *aldehyde-free alcohol R*. Allow to stand and add 1 ml of the supernatant liquid to the solution of the substance to be examined. Heat the mixture on a water-bath for 3 min. After cooling, add 3 ml of *water R* and 0.15 ml of *hydrochloric acid R*. Examined in ultraviolet light at 254 nm, the mixture shows an intense blue fluorescence.

E. Dissolve about 25 mg in 2 ml of a 42 g/l solution of *sodium hydroxide R* and heat in a water-bath for 5 min. Cool and add 0.25 ml of a mixture of equal volumes of *water R* and *sulphuric acid R*. Add 0.5 ml of a 100 g/l solution of *chromotropic acid, sodium salt R* and, carefully, 2 ml of *sulphuric acid R*. An intense violet colour is produced.

TESTS

Related substances. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.2 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.3 ml of the test solution to 100 ml with *alcohol R*.

Plate: TLC silica gel F_{254} plate *R*.

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Limits:

– *any impurity:* any spots, apart from the principal spot, are not more intense than the spot in the chromatogram obtained with the reference solution (0.3 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 2.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure of 0.1-0.5 kPa.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 100 ml of *methanol R* and add 5 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 30.31 mg of $C_{13}H_{12}Cl_2O_4$.

01/2005:1204

ETAMSYLATE

Etamsylatum

$C_{10}H_{17}NO_5S$

M_r 263.3

DEFINITION

Etamsylate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-ethylethanamine 2,5-dihydroxybenzenesulphonate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, freely soluble in methanol, soluble in ethanol, practically insoluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 127 °C to 134 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *etamsylate CRS*. Examine the substances prepared as discs.

C. Dissolve 0.100 g in *water R* and dilute to 200.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *water R*. Examined immediately between 210 nm and 350 nm (2.2.25), the solution shows two absorption, maxima at 221 nm and 301 nm. The specific absorbance at the maximum at 301 nm is 145 to 151.

01/2005:1591

D. In a test-tube, introduce 2 ml of freshly prepared solution S (see Tests) and 0.5 g of *sodium hydroxide R*. Warm the mixture and place near the open end of the tube a wet strip of *red litmus paper R*. The colour of the paper becomes blue.

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S, when freshly prepared, is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.5 to 5.6.

Hydroquinone. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 2.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *hydroquinone R* in *water R* and dilute to 50 ml with the same solvent.

Apply to the plate 10 µl of each solution and dry the starting points in a current of cool air. Develop over a path of 15 cm using a mixture of 20 volumes of *methylene chloride R*, 30 volumes of *methyl acetate R* and 50 volumes of *ethyl acetate R*. Dry the plate in a current of hot air and examine in ultraviolet light at 254 nm. Any spot corresponding to hydroquinone in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (15 ppm). Prepare the standard using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 10 ml of *water R* and 40 ml of *dilute sulphuric acid R*. Titrate with 0.1 M *cerium sulphate*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *cerium sulphate* is equivalent to 13.16 mg of $C_{18}H_{21}N_3O_4$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. benzene-1,4-diol (hydroquinone).

ETHACRIDINE LACTATE MONOHYDRATE

Ethacridini lactas monohydricus

DEFINITION

7-Ethoxyacridine-3,9-diamine (2*RS*)-2-hydroxypropanoate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: yellow crystalline powder.

Solubility: sparingly soluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ethacridine lactate monohydrate CRS*.

B. Mix 0.1 ml of solution S (see Tests) and 100 ml of *water R*. The solution is greenish-yellow and shows a strong green fluorescence in ultraviolet light at 365 nm. Add 5 ml of 1 M *hydrochloric acid*. The fluorescence remains.

C. To 0.5 ml of solution S add 1.0 ml of *water R*, 0.1 ml of a 10 g/l solution of *cobalt chloride R* and 0.1 ml of a 50 g/l solution of *potassium ferrocyanide R*. The solution is green.

D. To 50 ml of solution S add 10 ml of *dilute sodium hydroxide solution R*. Filter. To 5 ml of the filtrate, add 1 ml of *dilute sulphuric acid R*. 5 ml of the solution obtained gives the reaction of lactates (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

pH (2.2.3): 5.5 to 7.0 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: dissolve 1.0 g of *sodium octanesulphonate R* in a mixture of 300 ml of *acetonitrile R* and 700 ml of *phosphate buffer solution pH 2.8 R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 268 nm.

Injection: 10 µl.

Run time: 3 times the retention time of ethacridine.

Retention time: ethacridine = about 15 min.

Limits:

- **any impurity:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

1.0 g complies with limit test F. Prepare the standard using 5.0 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): 4.5 per cent to 5.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.270 g in 5.0 ml of *anhydrous formic acid* R. Add 60.0 ml of *acetic anhydride* R and titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 34.34 mg of C₁₈H₂₁N₃O₄.

STORAGE

Protected from light.

IMPURITIES

A. 6-amino-2-ethoxyacridin-9(10H)-one,

B. R = Cl: 6-chloro-2-ethoxyacridin-9-amine,

C. R = O-CH₂-CH₂-OH: 2-[(9-amino-7-ethoxyacridin-3-yl)oxy]ethanol.

01/2005:0553

ETHAMBUTOL HYDROCHLORIDE

Ethambutoli hydrochloridum

C₁₀H₂₆Cl₂N₂O₂

M_r 277.2

DEFINITION

Ethambutol hydrochloride contains not less than 97.0 per cent and not more than the equivalent of 101.0 per cent of 2,2'-(ethylenediimino)bis[(2S)-butan-1-ol] dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, soluble in alcohol.

It melts at about 202 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ethambutol hydrochloride* CRS. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for 2-aminobutanol. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).
- Dissolve 0.1 g in 10 ml of *water* R and add 0.2 ml of *copper sulphate solution* R. Add 0.5 ml of *dilute sodium hydroxide solution* R. A blue colour is produced.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.2 g in 10 ml of *carbon dioxide-free water* R. The pH of the solution is 3.7 to 4.0.

2-Aminobutanol. Examine by thin-layer chromatography (2.2.27), using *silica gel G* R as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol* R and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol* R.

Reference solution (a). Dissolve 50 mg of 2-aminobutanol R in *methanol* R and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *methanol* R.

Reference solution (b). Dissolve 50 mg of *ethambutol hydrochloride* CRS in *methanol* R and dilute to 10 ml with the same solvent.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia* R, 15 volumes of *water* R and 75 volumes of *methanol* R. Allow the plate to dry in air, heat at 110 °C for 10 min, cool and spray with *ninhydrin solution* R1. Heat the plate at 110 °C for 5 min. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 70 ml of *dilute ammonia R2* add 4.0 ml of *copper sulphate solution R*, mix, add 5.0 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*. Dissolve 0.100 g of the substance to be examined in 20 ml of this solution and dilute to 25.0 ml with the same solution. Prepare a reference solution in the same manner using 0.100 g of *ethambutol hydrochloride CRS*. Measure the angle of optical rotation (2.2.7) of the solutions at 436 nm. Calculate the content of $C_{10}H_{26}Cl_2N_2O_2$ from the angles of optical rotation measured and the concentrations of the solutions.

STORAGE

Store in an airtight container.

01/2005:1317

ETHANOL (96 PER CENT)

Ethanolum (96 per centum)

DEFINITION

Content:

- ethanol (C_2H_6O ; M_r 46.07): 95.1 per cent V/V (92.6 per cent m/m) to 96.9 per cent V/V (95.2 per cent m/m) at 20 °C, calculated from the relative density using the alcoholimetric tables (5.5),
- water.

CHARACTERS

Appearance: colourless, clear, volatile, flammable liquid, hygroscopic.

Solubility: miscible with water and with methylene chloride.

It burns with a blue, smokeless flame.

bp: about 78 °C.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for relative density (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum ethanol (96 per cent).

C. Mix 0.1 ml with 1 ml of a 10 g/l solution of *potassium permanganate R* and 0.2 ml of *dilute sulphuric acid R* in a test-tube. Cover immediately with a filter paper moistened with a freshly prepared solution containing 0.1 g of *sodium nitroprusside R* and 0.5 g of *piperazine hydrate R* in 5 ml of *water R*. After a few minutes, an intense blue colour appears on the paper and becomes paler after 10-15 min.

D. To 0.5 ml add 5 ml of *water R*, 2 ml of *dilute sodium hydroxide solution R*, then slowly add 2 ml of 0.05 *M* *iodine*. A yellow precipitate is formed within 30 min.

TESTS

Appearance. It is clear (2.2.1) and colourless (2.2.2, *Method II*) when compared with *water R*. Dilute 1.0 ml to 20 ml with *water R*. After standing for 5 min, the dilution remains clear (2.2.1) when compared with *water R*.

Acidity or alkalinity. To 20 ml add 20 ml of *carbon dioxide-free water R* and 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 1.0 ml of 0.01 *M* *sodium hydroxide*. The solution is pink (30 ppm, expressed as acetic acid).

Relative density (2.2.5): 0.805 to 0.812.

Absorbance (2.2.25): maximum 0.40 at 240 nm, 0.30 between 250 nm and 260 nm and 0.10 between 270 nm and 340 nm.

Examine between 235 nm and 340 nm, in a 5 cm cell using *water R* as the compensation liquid. The absorption curve is smooth.

Volatile impurities. Gas chromatography (2.2.28).

Test solution (a). The substance to be examined.

Test solution (b). Add 150 µl of 4-methylpentan-2-ol *R* to 500.0 ml of the substance to be examined.

Reference solution (a). Dilute 100 µl of *anhydrous methanol R* to 50.0 ml with the substance to be examined. Dilute 5.0 ml of the solution to 50.0 ml with the substance to be examined.

Reference solution (b). Dilute 50 µl of *anhydrous methanol R* and 50 µl of *acetaldehyde R* to 50.0 ml with the substance to be examined. Dilute 100 µl of the solution to 10.0 ml with the substance to be examined.

Reference solution (c). Dilute 150 µl of *acetal R* to 50.0 ml with the substance to be examined. Dilute 100 µl of the solution to 10.0 ml with the substance to be examined.

Reference solution (d). Dilute 100 µl of *benzene R* to 100.0 ml with the substance to be examined. Dilute 100 µl of the solution to 50.0 ml with the substance to be examined.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: poly[(cyanopropyl)(phenyl)][dimethylsiloxane *R* (film thickness 1.8 µm).

Carrier gas: helium for chromatography *R*.

Linear velocity: 35 cm/s.

Split ratio: 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12	40
	12 - 32	40 → 240
	32 - 42	240
Injection port		200
Detector		280

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (b):

- *resolution*: minimum 1.5 between the first peak (acetaldehyde) and the second peak (methanol).

Limits:

- *methanol* in the chromatogram obtained with test solution (a): not more than half the area of the corresponding peak in the chromatogram obtained with reference solution (a) (200 ppm V/V),
- *acetaldehyde + acetal*: maximum 10 ppm V/V , expressed as acetaldehyde.

Calculate the sum of the contents of acetaldehyde and acetal in parts per million (V/V) using the following expression:

$$\frac{10 \times A_E}{A_T - A_E} + \frac{30 \times C_E}{C_T - C_E}$$

A_E = area of the acetaldehyde peak in the chromatogram obtained with test solution (a),

A_T = area of the acetaldehyde peak in the chromatogram obtained with reference solution (b),

C_E = area of the acetal peak in the chromatogram obtained with test solution (a),

C_T = area of the acetal peak in the chromatogram obtained with reference solution (c).

– *benzene*: maximum 2 ppm V/V.

Calculate the content of benzene in parts per million (V/V) using the following expression:

$$\frac{2B_E}{B_T - B_E}$$

B_E = area of the benzene peak in the chromatogram obtained with the test solution (a),

B_T = area of the benzene peak in the chromatogram obtained with reference solution (d).

If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

– *total of other impurities* in the chromatogram obtained with test solution (b): not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with test solution (b) (300 ppm),

– *disregard limit*: 0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with test solution (b) (9 ppm).

Residue on evaporation: maximum 25 ppm *m/V*.

Evaporate 100 ml to dryness on a water-bath and dry at 100–105 °C for 1 h. The residue weighs a maximum of 2.5 mg.

STORAGE

Protected from light.

ETHANOL, ANHYDROUS

Ethanolum anhydricum

 C_2H_6O M_r 46.07

DEFINITION

Content: not less than 99.5 per cent V/V of C_2H_6O (99.2 per cent m/m), at 20 °C, calculated from the relative density using the alcoholimetric tables (5.5).

CHARACTERS

Appearance: colourless, clear, volatile, flammable liquid, hygroscopic.

Solubility: miscible with water and with methylene chloride. It burns with a blue, smokeless flame.

bp: about 78 °C.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for relative density (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of anhydrous ethanol.

C. Mix 0.1 ml with 1 ml of a 10 g/l solution of *potassium permanganate R* and 0.2 ml of *dilute sulphuric acid R* in a test-tube. Cover immediately with a filter paper moistened with a freshly prepared solution containing 0.1 g of *sodium nitroprusside R* and 0.5 g of *piperazine hydrate R* in 5 ml of *water R*. After a few minutes, an intense blue colour appears on the paper and becomes paler after 10-15 min.

D. To 0.5 ml add 5 ml of *water R*, 2 ml of *dilute sodium hydroxide solution R*, then slowly add 2 ml of 0.05 *M iodine*. A yellow precipitate is formed within 30 min.

TESTS

Appearance. It is clear (2.2.1) and colourless (2.2.2, *Method II*) when compared with *water R*. Dilute 1.0 ml to 20 ml with *water R*. After standing for 5 min, the dilution remains clear (2.2.1) when compared with *water R*.

Acidity or alkalinity. To 20 ml add 20 ml of *carbon dioxide-free water R* and 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 1.0 ml of 0.01 *M sodium hydroxide*. The solution is pink (30 ppm, expressed as acetic acid).

Relative density (2.2.5): 0.790 to 0.793.

Absorbance (2.2.25): maximum 0.40 at 240 nm, 0.30 between 250 nm and 260 nm, and 0.10 between 270 nm and 340 nm.

Examined between 235 nm and 340 nm in a 5 cm cell using *water R* as the compensation liquid. The absorption curve is smooth.

Volatile impurities. Gas chromatography (2.2.28).

Test solution (a). The substance to be examined.

Test solution (b). Add 150 µl of *4-methylpentan-2-ol R* to 500.0 ml of the substance to be examined.

Reference solution (a). Dilute 100 µl of *anhydrous methanol R* to 50.0 ml with the substance to be examined. Dilute 5.0 ml of the solution to 50.0 ml with the substance to be examined.

Reference solution (b). Dilute 50 µl of *anhydrous methanol R* and 50 µl of *acetaldehyde R* to 50.0 ml with the substance to be examined. Dilute 100 µl of the solution to 10.0 ml with the substance to be examined.

Reference solution (c). Dilute 150 µl of *acetal R* to 50.0 ml with the substance to be examined. Dilute 100 µl of the solution to 10.0 ml with the substance to be examined.

Reference solution (d). Dilute 100 µl of *benzene R* to 100.0 ml with the substance to be examined. Dilute 100 µl of the solution to 50.0 ml with the substance to be examined.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** poly[(cyanopropyl)(phenyl)]dimethylsiloxane *R* (film thickness 1.8 µm).

Carrier gas: helium for chromatography *R*.

Linear velocity: 35 cm/s.

Split ratio: 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12	40
	12 - 32	40 → 240
	32 - 42	240
Injection port		200
Detector		280

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (b):

- **resolution:** minimum 1.5 between the first peak (acetaldehyde) and the second peak (methanol).

Limits:

- **methanol:** in the chromatogram obtained with test solution (a): not more than half the area of the corresponding peak in the chromatogram obtained with reference solution (a) (200 ppm V/V).
- **acetaldehyde + acetal:** maximum of 10 ppm V/V , expressed as acetaldehyde.

Calculate the sum of the contents of acetaldehyde and acetal in parts per million (V/V) using the following expression:

$$\frac{10 \times A_E}{A_T - A_E} + \frac{30 \times C_E}{C_T - C_E}$$

A_E = area of the acetaldehyde peak in the chromatogram obtained with test solution (a),

A_T = area of the acetaldehyde peak in the chromatogram obtained with reference solution (b),

C_E = area of the acetal peak in the chromatogram obtained with test solution (a),

C_T = area of the acetal peak in the chromatogram obtained with reference solution (c).

- *benzene*: maximum 2 ppm V/V .

Calculate the content of benzene in parts per million (V/V) using the following expression:

$$\frac{2B_E}{B_T - B_E}$$

B_E = area of the benzene peak in the chromatogram obtained with the test solution (a),

B_T = area of the benzene peak in the chromatogram obtained with reference solution (d).

If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).

- *total of other impurities* in the chromatogram obtained with test solution (b): not more than the area of the peak due to 4-methylpentan-2-ol in the chromatogram obtained with test solution (b) (300 ppm),
- *disregard limit*: 0.03 times the area of the peak corresponding to 4-methylpentan-2-ol in the chromatogram obtained with test solution (b) (9 ppm).

Residue on evaporation: maximum 25 ppm m/V .

Evaporate 100 ml to dryness on a water-bath and dry at 100–105 °C for 1 h. The residue weighs a maximum of 2.5 mg.

STORAGE

Protected from light.

ETHER

Aether

$\text{C}_4\text{H}_{10}\text{O}$

M_r 74.1

DEFINITION

Ether is diethyl ether which may contain a suitable non-volatile antioxidant at a suitable concentration.

CHARACTERS

A clear, colourless liquid, volatile, highly flammable, soluble in water, miscible with alcohol, with methylene chloride and with fatty oils.

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
 B. It complies with the test for distillation range (see Tests).

TESTS

Acidity. To 20 ml of *alcohol R* add 0.25 ml of *bromothymol blue solution R1* and, dropwise, 0.02 M *sodium hydroxide* until a blue colour persists for 30 s. Add 25 ml of the substance to be examined, shake and add, dropwise, 0.02 M *sodium hydroxide* until the blue colour reappears and persists for 30 s. Not more than 0.4 ml of 0.02 M *sodium hydroxide* is required.

Relative density (2.2.5): 0.714 to 0.716.

Distillation range (2.2.11). *Do not distil if the substance to be examined does not comply with the test for peroxides.* It distils completely between 34.0 °C and 35.0 °C. Carry out the test using a suitable heating device and taking care to avoid directly heating the flask above the level of the liquid.

Non-volatile matter. *After ensuring that the substance to be examined complies with the test for peroxides,* evaporate 50 ml to dryness on a water-bath and dry the residue in an oven at 100 °C to 105 °C. The residue weighs not more than 1 mg (20 mg/l).

Substances with a foreign odour. Moisten a disc of filter paper 80 mm in diameter with 5 ml of the substance to be examined and allow to evaporate. No foreign odour is perceptible immediately after the evaporation.

Aldehydes. To 10.0 ml in a ground-glass-stoppered cylinder add 1 ml of *alkaline potassium tetraiodomercurate solution R* and shake for 10 s. Allow to stand for 5 min, protected from light. The lower layer may show yellow or reddish-brown opalescence but not grey or black opalescence.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 15 mm in diameter. Fill completely with the substance to be examined, mix and allow to stand protected from light for 5 min. No colour develops.

Water (2.5.12). Not more than 2 g/l, determined on 20 ml by the semi-micro determination of water.

STORAGE

Store in an airtight container, protected from light, at a temperature of 8 °C to 15 °C.

LABELLING

The label states, where appropriate, the name and concentration of any added non-volatile antioxidant.

DEFINITION

Anaesthetic ether is diethyl ether which may contain a suitable non-volatile antioxidant at an appropriate concentration.

CHARACTERS

A clear, colourless liquid, volatile, very mobile, highly flammable, soluble in 15 parts of water, miscible with alcohol and with fatty oils.

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
 B. It complies with the test for distillation range (see Tests).

TESTS

Relative density (2.2.5): 0.714 to 0.716.

Distillation range (2.2.11). *Do not distil if the substance to be examined does not comply with the test for peroxides.* It distils completely between 34.0 °C and 35.0 °C. Carry out the test using a suitable heating device and taking care to avoid directly heating the flask above the level of the liquid.

Acids. To 20 ml of *alcohol R* add 0.25 ml of *bromothymol blue solution R1* and, dropwise, 0.02 M *sodium hydroxide* until a blue colour persists for 30 s. Add 25 ml of the substance to be examined, shake and add, dropwise, 0.02 M *sodium hydroxide* until the blue colour reappears and persists for 30 s. Not more than 0.4 ml of 0.02 M *sodium hydroxide* is required.

Acetone and aldehydes. To 10.0 ml in a ground-glass-stoppered cylinder add 1 ml of *alkaline potassium tetra-iodomercurate solution R* and shake for 10 s. Allow to stand for 5 min, protected from light. The lower layer shows only a slight opalescence.

If the substance to be examined does not comply with the test, distil 40 ml, *after ensuring that the substance to be examined complies with the test for peroxides*, until only 5 ml remains. Collect the distillate in a receiver cooled by placing in a bath of iced water and repeat the test described above using 10.0 ml of the distillate.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 15 mm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

Non-volatile matter. *After ensuring that the substance to be examined complies with the test for peroxides,* evaporate 50 ml to dryness on a water-bath and dry the residue at 100 °C to 105 °C. The residue weighs not more than 1 mg (20 mg/l).

Substances with a foreign odour. Moisten a disc of filter paper 80 mm in diameter with 5 ml of the substance to be examined and allow to evaporate. No foreign odour is perceptible immediately after the evaporation.

Water (2.5.12). Not more than 2 g/l, determined on 20 ml by the semi-micro determination of water.

STORAGE

Store in an airtight container, protected from light, at a temperature of 8 °C to 15 °C. The contents of a partly filled container may deteriorate rapidly.

LABELLING

The label states, where appropriate, the name and concentration of any added non-volatile antioxidant.

ETHINYLESTRADIOL

Ethinylestradiolum

 $C_{20}H_{24}O_2$ M_r 296.4

DEFINITION

19-Nor-17 α -pregna-1,3,5(10)-trien-20-yne-3,17-diol.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellowish-white, crystalline powder.**Solubility:** practically insoluble in water, freely soluble in alcohol. It dissolves in dilute alkaline solutions.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ethinylestradiol CRS*.If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance in *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 25 ml with the same mixture of solvents.**Reference solution.** Dissolve 25 mg of *ethinylestradiol CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 25 ml with the same mixture of solvents.**Plate:** TLC silica gel G plate *R*.**Mobile phase:** *alcohol R*, *toluene R* (10:90 V/V).**Application:** 5 μ l.**Development:** over a path of 15 cm.**Drying:** in air until the solvent has evaporated.**Detection:** heat at 110 °C for 10 min, spray the hot plate with *alcoholic solution of sulphuric acid R* and heat again at 110 °C for 10 min. Examine in daylight and in ultraviolet light at 365 nm.**Results:** the principal spot in the chromatogram obtained with the test solution is similar in position, colour, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Specific optical rotation (2.2.7): -27 to -30 (dried substance).Dissolve 1.25 g in *pyridine R* and dilute to 25.0 ml with the same solvent.**Related substances.** Liquid chromatography (2.2.29).**Test solution.** Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.**Reference solution (a).** Dissolve 10 mg of *estradiol R* in the mobile phase, add 10.0 ml of the test solution and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.**Reference solution (b).** Dilute 10.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.**Column:**– **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,– **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 μ m).**Mobile phase:** *acetonitrile R*, *water R* (45:55 V/V).**Flow rate:** 1 ml/min.**Detection:** spectrophotometer at 280 nm.**Injection:** 20 μ l.**Run time:** 2.5 times the retention time of ethinylestradiol.**Relative retention** with reference to ethinylestradiol (retention time = about 4.6 min): impurity D = about 0.76, impurity B = about 0.94.**System suitability:** reference solution (a):– **resolution:** minimum 3.5 between the peaks due to impurity D and ethinylestradiol.**Limits:**– **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),– **any other impurity:** not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),– **total of other impurities:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent)– **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent)**Loss on drying** (2.2.32): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C for 3 h.

ASSAY

Dissolve 0.200 g in 40 ml of *tetrahydrofuran R* and add 5 ml of a 100 g/l solution of *silver nitrate R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.1 ml of 0.1 M *sodium hydroxide* is equivalent to 29.64 mg of $C_{20}H_{24}O_2$.

STORAGE

Protected from light.

IMPURITIES

A. $R_1 = OH$, $R_2 = C\equiv CH$: 19-norpregna-1,3,5(10)-trien-20-yne-3,17-diol (17 β -ethinylestradiol),C. $R_1 + R_2 = O$: 3-hydroxyestra-1,3,5(10)-trien-17-one (estrone),D. $R_1 = H$, $R_2 = OH$: estradiol,

B. 19-nor-17 α -pregna-1,3,5(10),9(11)-tetraen-20-yne-3,17-diol.

01/2005:0141

ETHIONAMIDE

Ethionamidum

 $C_8H_{10}N_2S$ M_r 166.2

DEFINITION

Ethionamide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-ethylpyridine-4-carbothioamide, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder or small, yellow crystals, practically insoluble in water, soluble in methanol, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- A. Melting point (2.2.14): 158 °C to 164 °C.
- B. Dissolve 10.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 290 nm. The specific absorbance at the maximum is 380 to 440.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ethionamide CRS*.
- D. Dissolve about 10 mg in 5 ml of *methanol R*. Add 5 ml of *silver nitrate solution R2*. A dark-brown precipitate is formed.

TESTS

Appearance of solution. Dissolve 0.5 g in 10 ml of *methanol R*, heating to about 50 °C. Allow to cool to room temperature. The solution is not more opalescent than reference suspension II (2.2.1).

Acidity. Dissolve 2.0 g in 20 ml of *methanol R*, heating to about 50 °C, and add 20 ml of *water R*. Cool slightly while shaking until crystallisation begins and then allow to cool to room temperature. Add 60 ml of *water R* and 0.2 ml of *cresol red solution R*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100 ml with *acetone R*.

Reference solution (b). Dilute 0.2 ml of the test solution to 100 ml with *acetone R*.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and at most 1 such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 16.62 mg of $C_8H_{10}N_2S$.

01/2005:0764

ETHOSUXIMIDE

Ethosuximidum

 $C_7H_{11}NO_2$ M_r 141.2

DEFINITION

(*RS*)-3-Ethyl-3-methylpyrrolidine-2,5-dione.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder or waxy solid.

Solubility: freely soluble in water, very soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 45 °C to 50 °C.
- B. Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Examined between 230 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 248 nm. The specific absorbance at the maximum is 8 to 9.
- C. Infrared absorption spectrophotometry (2.2.24).
Preparation: discs of *potassium bromide R*.

Comparison: ethosuximide CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

- D. Dissolve 0.1 g in 3 ml of *methanol R*. Add 0.05 ml of a 100 g/l solution of *cobalt chloride R* and 0.05 ml of a 100 g/l solution of *calcium chloride R* and add 0.1 ml of *dilute sodium hydroxide solution R*. A purple colour develops and no precipitate is formed.
- E. To about 10 mg add 10 mg of *resorcinol R* and 0.2 ml of *sulphuric acid R*. Heat at 140 °C for 5 min and cool. Add 5 ml of *water R* and 2 ml of *concentrated ammonia R1*. A brown colour is produced. Add about 100 ml of *water R*. A green fluorescence is produced.

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Cyanide. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 0.125 g of *potassium cyanide R* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *water R*. Dilute 0.5 ml of this solution to 10.0 ml with *water R*.

Reference solution (b). Dissolve 0.50 g of the substance to be examined in *water R*, add 0.5 ml of reference solution (a) and dilute to 10.0 ml with *water R*.

Column:

- *size:* $l = 0.075$ m, $\varnothing = 7.5$ mm,
- *stationary phase:* spherical *weak anion exchange resin* (10 μ m).

Mobile phase: dissolve 2.1 g of *lithium hydroxide R* and 85 mg of *sodium edetate R* in *water for chromatography R* and dilute to 1000.0 ml with the same solvent.

Flow rate: 2.0 ml/min.

Detection: electrochemical detector (direct amperometry) with a silver working electrode, a silver-silver chloride reference electrode, held at + 0.05 V oxidation potential, and a detector sensitivity of 20 nA full scale.

Injection: 20 μ l; inject the test solution and reference solution (b).

System suitability: reference solution (b):

- *peak-to-valley ratio:* minimum 3, where H_p = height above the baseline of the peak due to cyanide and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ethosuximide.

Limit:

- *cyanide:* not more than half the height of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 ppm).

Related substances. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 20 mg of *myristyl alcohol R* in *ethanol R* and dilute to 10.0 ml with the same solvent.

Test solution. Dissolve 1.00 g of the substance to be examined in *ethanol R*, add 1.0 ml of the internal standard solution and dilute to 20.0 ml with *ethanol R*.

Reference solution (a). Dissolve 20.0 mg of *ethosuximide impurity A CRS* in *ethanol R* and dilute to 10.0 ml with the same solvent. To 0.5 ml of the solution, add 1.0 ml of the internal standard solution and dilute to 20.0 ml with *ethanol R*.

Reference solution (b). Dissolve 0.500 g of the substance to be examined in *ethanol R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml to 50.0 ml with *ethanol R*. To 2.0 ml of this solution, add 1.0 ml of the internal standard solution and dilute to 20.0 ml with *ethanol R*.

Column:

- *material:* fused silica,
- *size:* $l = 30$ m, $\varnothing = 0.25$ mm,
- *stationary phase:* *poly(cyanopropyl)(phenylmethyl)siloxane R* (film thickness 0.25 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:67.

Temperature:

- *column:* 175 °C,
- *injection port and detector:* 240 °C.

Detection: flame ionisation.

Injection: 1 μ l.

Run time: 1.5 times the retention time of ethosuximide.

Relative retentions with reference to the internal standard (retention time = about 8 min): impurity A = about 0.7; ethosuximide = about 1.1.

System suitability: reference solution (b):

- *resolution:* minimum 5 between the peaks due to the internal standard and to ethosuximide.

Limits:

- *impurity A:* calculate the ratio (R) of the area of the peak due to impurity A to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (a); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak due to impurity A to the area of the peak due to the internal standard: this ratio is not greater than R (0.1 per cent),
- *any other impurity:* calculate the ratio (R) of half the area of the peak due to ethosuximide to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak, apart from the principal peak and the peaks due to impurity A and to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than R (0.1 per cent),
- *total:* calculate the ratio (R) of the area of the peak due to ethosuximide to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than R (0.2 per cent),
- *disregard limit:* calculate the ratio (R) of 0.25 times the area of the peak due to impurity A to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (a); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak, apart from the principal peak and the peak due to the internal

standard, to the area of the peak due to the internal standard: disregard any peak which has a ratio less than *R* (0.025 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution *S* complies with limit test *A*. Prepare the standard using *lead standard solution* (1 ppm *Pb*) *R*.

Water (2.5.12): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.120 g in 20 ml of *dimethylformamide R* and carry out a potentiometric titration (2.2.20) using 0.1 *M* *tetrabutylammonium hydroxide*. Protect the solution from atmospheric carbon dioxide throughout the titration. Carry out a blank titration.

1 ml of 0.1 *M* *tetrabutylammonium hydroxide* is equivalent to 14.12 mg of $C_7H_{11}NO_2$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

A. (2*RS*)-2-ethyl-2-methylbutanedioic acid.

01/2005:0899

ETHYL ACETATE

Ethylis acetas

$C_4H_8O_2$

M_r 88.1

DEFINITION

Ethyl acetate is ethyl ethanoate.

CHARACTERS

A clear, colourless liquid, volatile, soluble in water, miscible with acetone, with alcohol and with methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Boiling point (2.2.12): 76 °C to 78 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of ethyl acetate*.

C. It gives the reaction of acetyl (2.3.1).

D. It gives the reaction of esters (2.3.1).

TESTS

Appearance of solution. A mixture of 1 ml of the substance to be examined and 15 ml of *water R* is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 10 ml of *alcohol R* add 0.1 ml of *phenolphthalein solution R* and 0.01 *M* *sodium hydroxide* until the colour changes to pink. Add 5.5 ml of the substance to be examined and 0.25 ml of 0.02 *M* *sodium hydroxide*. The solution remains pink for not less than 15 s.

Relative density (2.2.5): 0.898 to 0.902.

Refractive index (2.2.6): 1.370 to 1.373.

Reaction with sulphuric acid. Carefully add 2 ml to 10 ml of *sulphuric acid R*. After 15 min, the interface between the two liquids is not coloured.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

The chromatographic procedure may be carried out using:

- a glass column 2 m long and 2 mm in internal diameter, packed with *ethylvinylbenzene-divinylbenzene copolymer R* (136 µm to 173 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

raising the temperature at a rate of 8 °C/min from 90 °C to 240 °C and maintaining at 240 °C for 8 min and maintaining the temperature of the injection port and that of the detector at 240 °C.

Inject 1 µl of the test solution. In the chromatogram obtained with the test solution, the sum of the areas of any peaks apart from the principal peak is not greater than 0.2 per cent of the area of the principal peak.

Residue on evaporation. Evaporate 100.0 g to dryness on a water-bath and dry in an oven at 100 °C to 105 °C. The residue weighs not more than 3 mg (30 ppm).

Water (2.5.12). Not more than 0.1 per cent, determined on 10.0 ml by the semi-micro determination of water.

STORAGE

Store protected from light, at a temperature not exceeding 30 °C.

IMPURITIES

- A. methyl acetate,
- B. ethanol,
- C. methanol.

01/2005:1319

ETHYL OLEATE

Ethylis oleas

DEFINITION

Ethyl oleate is a mixture consisting of the ethyl esters of fatty acids, mainly oleic acid. A suitable antioxidant may be added.

CHARACTERS

A clear, pale yellow or colourless liquid, practically insoluble in water, miscible with alcohol, with methylene chloride and with light petroleum (40 °C to 60 °C).

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
- B. It complies with the test for saponification value (see Tests).
- C. It complies with the test of oleic acid (see Tests).

TESTS

Relative density (2.2.5): 0.866 to 0.874.

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g.

Iodine value (2.5.4): 75 to 90.

Peroxide value (2.5.5). Not more than 10.0.

Saponification value (2.5.6): 177 to 188, determined on 2.0 g.

Oleic acid (2.4.22, *Method A*). The fatty acid fraction of the substance contains at least 60.0 per cent of oleic acid.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 2.0 g.

STORAGE

Store protected from light.

LABELLING

The label states, where applicable, the name and concentration of any added antioxidant.

sodium carbonate solution R; the substance partly dissolves (solution B). Add at the same time to solution A and solution B 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. Solution B is yellow to orange-brown. Solution A is orange to red, the colour being clearly more intense than any similar colour which may be obtained with solution B.

TESTS

Solution S. Dissolve 1.0 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity. To 2 ml of solution S add 3 ml of *alcohol R*, 5 ml of *carbon dioxide-free water R* and 0.1 ml of *bromocresol green solution R*. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *methyl parahydroxybenzoate R* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Plate: suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Mobile phase: *glacial acetic acid R*, *water R*, *methanol R* (1:30:70 V/V/V).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Limits:

- *any impurity:* any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 1.000 g add 20.0 ml of 1 M *sodium hydroxide*. Heat at about 70 °C for 1 h. Cool rapidly in an ice bath. Prepare a blank in the same manner. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 0.5 M *sulphuric acid*, continuing the titration until the second point of inflexion and determining the end-point potentiometrically (2.2.20).

1 ml of 1 M *sodium hydroxide* is equivalent to 166.2 mg of C₉H₁₀O₃.

01/2005:0900

ETHYL PARAHYDROXYBENZOATE

Ethylis parahydroxybenzoas

C₉H₁₀O₃M_r 166.2

DEFINITION

Ethyl 4-hydroxybenzoate.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 115 °C to 118 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ethyl parahydroxybenzoate CRS*.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool (solution A). To a further 10 mg in a similar test-tube add 1 ml of

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,
 B. R = CH₃: methyl 4-hydroxybenzoate,
 C. R = CH₂-CH₂-CH₃: propyl 4-hydroxybenzoate,
 D. R = CH₂-CH₂-CH₂-CH₃: butyl 4-hydroxybenzoate.

01/2005:0822

ETHYLCELLULOSE

Ethylcellulosum

DEFINITION

Partly *O*-ethylated cellulose.

Content: 44.0 per cent to 51.0 per cent of ethoxy (-OC₂H₅) groups (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder or granular powder, odourless or almost odourless.

Solubility: practically insoluble in water, soluble in methylene chloride and in a mixture of 20 g of alcohol and 80 g of toluene, slightly soluble in ethyl acetate and in methanol, practically insoluble in glycerol (85 per cent) and in propylene glycol. The solutions may show a slight opalescence.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of ethylcellulose.

- B. It complies with the limits of the assay.

TESTS

Acidity or alkalinity. To 0.5 g add 25 ml of *carbon dioxide-free water R* and shake for 15 min. Filter through a sintered-glass filter (40). To 10 ml add 0.1 ml of *phenolphthalein solution R* and 0.5 ml of 0.01 M *sodium hydroxide*. The solution is pink. To 10 ml add 0.1 ml of *methyl red solution R* and 0.5 ml of 0.01 M *hydrochloric acid*. The solution is red.

Viscosity (2.2.9). The viscosity, determined at 25 °C and expressed in mPas, is not less than 80.0 per cent and not more than 120.0 per cent of that stated on the label for a nominal viscosity greater than 6 mPas; and not less than 75.0 per cent and not more than 140.0 per cent of that stated on the label for a nominal viscosity not greater than 6 mPas. Shake a quantity of the substance to be examined equivalent to 5.00 g of the dried substance with 95 g of a mixture of 20 g of *alcohol R* and 80 g of *toluene R* until the substance is dissolved. Determine the viscosity using a capillary viscometer.

Acetaldehyde: maximum 100 ppm.

Introduce 3.0 g into a 250 ml conical flask with a ground-glass stopper, add 10 ml of *water R* and stir mechanically for 1 h. Allow to stand for 24 h, filter and dilute the filtrate to 100.0 ml with *water R*. Transfer 5.0 ml to a 25 ml volumetric flask, add 5 ml of a 0.5 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* and

heat in a water-bath at 60 °C for 5 min. Add 2 ml of *ferric chloride-sulphamic acid reagent R* and heat again at 60 °C for 5 min. Cool and dilute to 25.0 ml with *water R*. The solution is not more intensely coloured than a standard prepared at the same time and in the same manner using instead of the 5.0 ml of filtrate, 5.0 ml of a reference solution prepared by diluting 3.0 ml of *acetaldehyde standard solution* (100 ppm C₂H₄O) *R1* to 100.0 ml with *water R*.

Chlorides (2.4.4): maximum 0.1 per cent.

Disperse 0.250 g in 50 ml of *water R*, heat to boiling and allow to cool, shaking occasionally. Filter and discard the first 10 ml of the filtrate. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (2.2.28).

CAUTION: *hydriodic acid* and its reaction by-products are highly toxic. Perform all steps for preparation of the test and reference solutions in a properly functioning hood.

Internal standard solution. Dilute 120 µl of *toluene R* to 10 ml with *o-xylene R*.

Test solution. Transfer 50.0 mg of the substance to be examined, 50.0 mg of *adipic acid R* and 2.0 ml of the internal standard solution into a suitable 5 ml thick-walled reaction vial with a pressure-tight septum-type closure. Cautiously add 2.0 ml of *hydriodic acid R*, immediately close the vial tightly and weigh the contents and the vial accurately. Shake the vial for 30 s, heat to 125 °C for 10 min, allow to cool for 2 min, shake again for 30 s and heat to 125 °C for 10 min. Afterwards allow to cool for 2 min and repeat shaking and heating for a third time. Allow the vial to cool for 45 min and reweigh. If the loss is greater than 10 mg, discard the mixture and prepare another. Use the upper layer.

Reference solution. Transfer 100.0 mg of *adipic acid R*, 4.0 ml of the internal standard solution and 4.0 ml of *hydriodic acid R* into a suitable 10 ml thick-walled reaction vial with a pressure-tight septum-type closure. Close the vial tightly and weigh the vial and contents accurately. Afterwards inject 50 µl of *iodoethane R* through the septum with a syringe, weigh the vial again and calculate the mass of *iodoethane* added, by difference. Shake well and allow the layers to separate.

Column:

- *material:* stainless steel,
- *size:* *l* = 5.0 m, Ø = 2 mm,
- *stationary phase:* *diatomaceous earth for gas chromatography R* (150-180 µm) impregnated with 3 per cent *m/m* of *poly(dimethyl)siloxane R*.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 15 ml/min.

Temperature:

- *column:* 80 °C,
- *injection port and detector:* 200 °C.

Detection: flame ionisation.

Injection: 1 µl of the upper layer of the test solution and 1 µl of the upper layer of the reference solution.

Relative retention with reference to toluene: iodoethane = about 0.6; *o*-xylene = about 2.3.

System suitability: reference solution:

- **resolution:** minimum 2.0 between the peaks due to iodoethane and toluene.

Calculate the percentage content of ethoxy groups from the following expression:

$$\frac{Q_1 \times m_2 \times 45.1 \times 100 \times 100}{2 \times Q_2 \times m_1 \times 156.0 \times (100 - d)}$$

- Q_1 = ratio of iodoethane peak area to toluene peak area in the chromatogram obtained with the test solution,
- Q_2 = ratio of iodoethane peak area to toluene peak area in the chromatogram obtained with the reference solution,
- m_1 = mass of the substance to be examined used in the test solution, in milligrams,
- m_2 = mass of iodoethane used in the reference solution, in milligrams,
- d = percentage loss on drying.

LABELLING

The label states the nominal viscosity in millipascal seconds for a 5 per cent *m/m* solution.

01/2005:1421

ETHYLENE GLYCOL MONOPALMITOSTEARATE

Ethylenglycoli monopalmitostearas

DEFINITION

Mixture of ethylene glycol mono- and diesters of stearic and palmitic acids, produced from the condensation of ethylene glycol and stearic acid 50 of vegetable or animal origin (see *Stearic acid* (1474)).

Content: minimum of 50.0 per cent of monoesters.

CHARACTERS

Appearance: white or almost white, waxy solid.

Solubility: practically insoluble in water, soluble in acetone and in hot alcohol.

IDENTIFICATION

- It complies with the test for melting point (see Tests).
- It complies with the test for composition of fatty acids (see Tests).
- It complies with the assay (monoesters content).

TESTS

Melting point (2.2.15): 54 °C to 60 °C.

Acid value (2.5.1): maximum 3.0, determined on 10.0 g.

Iodine value (2.5.4): maximum 3.0.

Saponification value (2.5.6): 170 to 195, determined on 2.0 g.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction has the following composition:

- *stearic acid*: 40.0 per cent to 60.0 per cent,
- *sum of contents of palmitic acid and stearic acid*: minimum 90.0 per cent.

Free ethylene glycol: maximum 5.0 per cent, determined as prescribed under Assay.

Total ash (2.4.16): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (2.2.30).

Test solution. Into a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Heat gently, if necessary. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, weigh, to the nearest 0.1 mg, about 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *ethylene glycol R*. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Weigh the flasks again and calculate the concentration of ethylene glycol in milligrams per gram for each reference solution.

Column:

- **size:** *l* = 0.6 m, Ø = 7 mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (particle diameter 5 µm and pore size 10 nm).

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to ethylene glycol: diesters = about 0.76, monoesters = about 0.83.

Limits:

- **free ethylene glycol:** from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- **monoesters:** calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A + B} \times (100 - D)$$

- A = area of the peak due to the monoesters,
- B = area of the peak due to the diesters,
- D = percentage content of free ethylene glycol + percentage content of free fatty acids which may be determined using the following expression:
- $$\frac{I_A \times 270}{561.1}$$
- I_A = acid value.

STORAGE

Protected from light.

01/2005:0716

ETHYLENEDIAMINE

Ethylendiaminum

$\text{C}_2\text{H}_8\text{N}_2$

M_r 60.1

DEFINITION

Ethylenediamine contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of ethane-1,2-diamine.

CHARACTERS

A clear, colourless or slightly yellow liquid, hygroscopic, miscible with water and with ethanol. On exposure to air, white fumes are evolved. On heating, it evaporates completely.

IDENTIFICATION

- A. Relative density (2.2.5): 0.895 to 0.905.
 B. Boiling point (2.2.12): 116 °C to 118 °C.
 C. To 0.2 ml add 0.5 ml of *acetic anhydride R*. Boil. A crystalline mass forms after cooling, which dissolves in 5 ml of *2-propanol R* with heating. Cool the solution and add 5 ml of *ether R*. If necessary, initiate crystallisation by scratching the walls of the test-tube with a glass rod. Filter through a sintered-glass filter, wash with several portions of *ether R* and dry at 100 °C to 105 °C. The residue melts (2.2.14) at 173 °C to 177 °C.

TESTS

Solution S. Mix 10 g with *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than the reference solution BY₆ (2.2.2, *Method II*).

Carbonate. A mixture of 4 ml of solution S and 6 ml of *calcium hydroxide solution R* is not more opalescent than reference suspension II (2.2.1).

Chlorides (2.4.4). To 5 ml of solution S add 5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. This solution complies with the limit test for chlorides (100 ppm).

Ammonia and other bases. Dissolve 1.2 g in 20 ml of *alcohol R* and add, dropwise with stirring, 4.5 ml of *hydrochloric acid R*. Evaporate to dryness on a water-bath, breaking up any resulting cake with a glass rod, and dry at 100 °C to 105 °C for 1 h.

1 g of the residue is equivalent to 0.4518 g of C₂H₈N₂. The percentage content of C₂H₈N₂ found in this test does not vary by more than 0.5 from the percentage content determined in the assay.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Residue on evaporation. Evaporate 5.00 g to dryness on a water-bath and dry at 100 °C to 105 °C for 1 h. The residue weighs not more than 15 mg (0.3 per cent).

ASSAY

Place 25.0 ml of *1 M hydrochloric acid* and 0.2 ml of *methyl red mixed solution R* in a flask. Add 0.600 g of the substance to be examined. Titrate with *1 M sodium hydroxide* until the colour changes from violet-red to green.

1 ml of *1 M hydrochloric acid* is equivalent to 30.05 mg of C₂H₈N₂.

STORAGE

Store in an airtight container, protected from light.

01/2005:0491

ETHYLMORPHINE HYDROCHLORIDE

Ethylmorphini hydrochloridum

C₁₉H₂₄ClNO₃·2H₂OM_r 385.9

DEFINITION

7,8-Didehydro-4,5α-epoxy-3-ethoxy-17-methylmorphinan-6α-ol hydrochloride dihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water and in alcohol, insoluble in cyclohexane.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of *ethylmorphine hydrochloride*.

B. In a test-tube, dissolve 0.5 g in 6 ml of *water R* and add 15 ml of *0.1 M sodium hydroxide*. Scratch the wall of the tube with a glass rod. A white, crystalline precipitate is formed. Collect the precipitate, wash and dissolve in 20 ml of *water R* heated to 80 °C. Filter and cool in iced water. The crystals, after drying *in vacuo* for 12 h, melt (2.2.14) at 85 °C to 89 °C.

C. To about 10 mg add 1 ml of *sulphuric acid R* and 0.05 ml of *ferric chloride solution R2*. Heat on a water-bath. A blue colour develops. Add 0.05 ml of *nitric acid R*. The colour becomes red.

D. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *methyl red solution R* and 0.2 ml of *0.02 M hydrochloric acid*, the solution is red. Add 0.4 ml of *0.02 M sodium hydroxide*, the solution becomes yellow.

Specific optical rotation (2.2.7): −102 to −105 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 25.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 12.5 mg of *codeine R* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (c). Dilute 0.5 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). To 1.0 ml of the test solution, add 1.0 ml of reference solution (b) and dilute to 50.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octylsilyl silica gel for chromatography *R* (5 μ m),
- **temperature:** 30 °C.

Mobile phase: add 1.25 g of *sodium heptanesulphonate R* to a mixture of 12.5 ml of *glacial acetic acid R* and 5 ml of a 20 per cent *V/V* solution of *triethylamine R* in a mixture of equal volumes of *methanol R* and *water R*. Dilute to 1000 ml with *water R*. To 550 ml of this solution add 450 ml of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 μ l.

Run time: 4 times the retention time of ethylmorphine.

Relative retention with reference to ethylmorphine (retention time = about 6.2 min): impurity B = about 0.7; impurity C = about 0.8; impurity D = about 1.3; impurity A = about 2.5.

System suitability: reference solution (d):

- **resolution:** minimum 5 between the peaks due to ethylmorphine and impurity C.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity D by 0.4,
- **impurities A, B, D:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **any other impurity:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total of impurities other than C:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): 8.0 per cent to 10.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5 ml of 0.01 *M* hydrochloric acid and 30 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 34.99 mg of $C_{19}H_{24}ClNO_3$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. $R = R' = C_2H_5$: 7,8-didehydro-4,5 α -epoxy-3,6 α -diethoxy-17-methylmorphinan,

B. $R = R' = H$: morphine,

C. $R = CH_3$, $R' = H$: codeine,

D. 7,8-didehydro-4,5 α -epoxy-3-ethoxy-17-methylmorphinan-6-one (ethylmorphinone).

01/2005:1205

ETILEFRINE HYDROCHLORIDE

Etilefrini hydrochloridum

$C_{10}H_{16}ClNO_2$

M_r 217.7

DEFINITION

(1*RS*)-2-(Ethylamino)-1-(3-hydroxyphenyl)ethanol hydrochloride.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 118 °C to 122 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of *potassium chloride R*.

Comparison: *etilefrine hydrochloride CRS*.

C. Thin-layer chromatography (2.2.27).

Prepare the solutions protected from bright light and develop the chromatograms protected from light.

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *etilefrine hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *phenylephrine hydrochloride CRS* in 2 ml of reference solution (a) and dilute to 10 ml with *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: concentrated ammonia *R*, *methanol R*, *methylene chloride R* (5:25:70 V/V/V).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a 10 g/l solution of *potassium permanganate R*; examine in daylight after 15 min.

System suitability: reference solution (b):

- the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- D. To 0.2 ml of solution S (see Tests), add 1 ml of *water R*, 0.1 ml of *copper sulphate solution R* and 1 ml of *strong sodium hydroxide solution R*. A blue colour is produced. Add 2 ml of *ether R* and shake. The upper layer is colourless.

- E. Dilute 1 ml of solution S to 10 ml with *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. Dilute 4 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$, determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *water R*. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Reference solution (b). Dissolve 10.0 mg of *etilefrine impurity A CRS* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with *water R*.

Reference solution (c). To 10.0 ml of reference solution (a) add 5.0 ml of reference solution (b) and dilute to 20.0 ml with *water R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of a 1.1 g/l solution of *sodium laurilsulfate R* adjusted to pH 2.3 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 5 times the retention time of etilefrine.

Relative retention with reference to etilefrine (retention time = about 9 min): impurity E = about 0.5; impurity C = about 0.8; impurity B = about 0.9; impurity A = about 1.2; impurity F = about 1.7; impurity D = about 4.5.

System suitability: reference solution (c):

- resolution: minimum 2.5 between the peaks due to etilefrine and impurity A.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- impurities B, C, D, E: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- any other impurity: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- sum of impurities other than A: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent); disregard any peak due to the solvent.

Sulphates (2.4.13): maximum 200 ppm, determined on 15 ml of solution S.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 20 ml of *anhydrous acetic acid R* and 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 21.77 mg of $C_{10}H_{16}ClNO_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F.

A. R = H: 2-(ethylamino)-1-(3-hydroxyphenyl)ethanone (etilefrone),

D. R = CH₂-C₆H₅: 2-(benzylethylamino)-1-(3-hydroxyphenyl)ethanone (benzyletilefrone),B. R = CH₃: (1*RS*)-1-(3-hydroxyphenyl)-2-(methylamino)ethanol (phenylephrine),C. R = H: (1*RS*)-2-amino-1-(3-hydroxyphenyl)ethanol (norfenefrine),

E. 1-(3-hydroxyphenyl)ethanone (3-hydroxyacetophenone),

F. *N*-benzylethanamine (benzylethylamine).

Second identification: A, C.

A. Melting point (2.2.14): 144 °C to 150 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *etodolac CRS*.C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R* previously activated by heating at 105 °C for 1 h.*Test solution.* Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.*Reference solution.* Dissolve 10 mg of *etodolac CRS* in *acetone R* and dilute to 10 ml with the same solvent.Place the plate in an unsaturated chamber containing a mixture of 20 volumes of a 25 g/l solution of *ascorbic acid R* and 80 volumes of *methanol R*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 min.

Apply separately to the plate 10 µl of each solution.

Develop over a path of 15 cm using a mixture of 0.5 volumes of *glacial acetic acid R*, 30 volumes of *ethanol R* and 70 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Optical rotation (2.2.7). Dissolve 2.50 g in *methanol R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation is -0.10° to +0.10°.**Related substances.** Examine by liquid chromatography (2.2.29).*Test solution.* Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.*Reference solution (a).* Dilute 5.0 ml of the test solution to 50.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*.*Reference solution (b).* Dissolve 1.0 mg of *etodolac impurity H CRS* and 1.0 mg of *etodolac CRS* in *methanol R* and dilute to 50 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min:

Mobile phase A. A mixture of 312 volumes of *methanol R* and 688 volumes of a solution prepared as follows: dissolve 13.6 g of *potassium dihydrogen phosphate R* in 900 ml of *water R*, adjust the pH to 7.0 with a 300 g/l solution of *potassium hydroxide R* and dilute to 1000 ml with *water R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	90 → 80	10 → 20	linear gradient
20 - 40	80 → 50	20 → 50	linear gradient
40 - 45	90	10	switch to initial conditions
45 - 55	90	10	re-equilibration

— as detector a spectrophotometer set at 225 nm, maintaining the temperature of the column at 40 °C.

01/2005:1422

ETODOLAC

Etodolacum

C₁₇H₂₁NO₃M_r 287.4

DEFINITION

Etodolac contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2-[(1*RS*)-1,8-diethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in ethanol.

IDENTIFICATION

First identification: B.

Inject 10 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 10 µl of reference solution (b). When the chromatogram is recorded in the prescribed conditions, the retention times are: impurity H about 8 min and etodolac about 9 min. The test is not valid unless the resolution between the peaks due to impurity H and etodolac is at least 5.0.

Inject separately 10 µl of the test solution and 10 µl of reference solution (a). In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all of the peaks apart from the principal peak is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Chlorides. Not more than 300 ppm. Dissolve 1.0 g of the substance to be examined in 60 ml of *methanol R*, add 10 ml of *water R* and 20 ml of *dilute nitric acid R*. Titrate with 0.01 M *silver nitrate*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.01 M *silver nitrate* is equivalent to 0.3545 mg Cl.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 60 ml of *methanol R*. Titrate with 0.1 M *tetrabutylammonium hydroxide* determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 28.74 mg of C₁₇H₂₁NO₃.

IMPURITIES

- A. R1 = H, R2 = CH₂-CH₃: 2-[(1*RS*)-1-ethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (8-desethyl etodolac),
- B. R1 = CH₃, R2 = CH₂-CH₃: 2-[(1*RS*)-1-ethyl-8-methyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (8-methyl etodolac),
- C. R1 = CH₂-CH₃, R2 = CH₃: 2-[(1*RS*)-8-ethyl-1-methyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (1-methyl etodolac),
- D. R1 = CH(CH₃)₂, R2 = CH₂-CH₃: 2-[(1*RS*)-1-ethyl-8-(1-methylethyl)-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (8-isopropyl etodolac),
- E. R1 = CH₂-CH₂-CH₃, R2 = CH₂-CH₃: 2-[(1*RS*)-1-ethyl-8-propyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (8-propyl etodolac),

- F. R1 = CH₂-CH₃, R2 = CH(CH₃)₂: 2-[(1*RS*)-8-ethyl-1-(1-methylethyl)-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (1-isopropyl etodolac),
- G. R1 = CH₂-CH₃, R2 = CH₂-CH₂-CH₃: 2-[(1*RS*)-8-ethyl-1-propyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid (1-propyl etodolac),

- H. 2-(7-ethylindol-3-yl)ethanol,

- I. (3*RS*)-3-[7-ethyl-3-(2-hydroxyethyl)indol-2-yl]-3-(7-ethylindol-3-yl)pentanoic acid (etodolac dimer),

- J. R = CH₃: (1*RS*)-1,8-diethyl-1-methyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indole (decarboxy etodolac),

- K. R = CH₂-CO-O-CH₃: methyl 2-[(1*RS*)-1,8-diethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetate (etodolac methyl ester),

- L. (*EZ*)-3-[7-ethyl-3-(2-hydroxyethyl)-1*H*-indol-2-yl]pent-3-enoic acid.

01/2005:1513

ETOFENAMATE

Etofenamatum

C₁₈H₁₈F₃NO₄M_r 369.4

DEFINITION

2-(2-Hydroxyethoxy)ethyl 2-[[3-(trifluoromethyl)phenyl]amino]benzoate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: yellowish viscous liquid.

Solubility: practically insoluble in water, miscible with alcohol and with ethyl acetate.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: etofenamate CRS.

Preparation: films.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution GY₁ (2.2.2, Method II).

Impurity F. Gas chromatography (2.2.28).

Internal standard: tetradecane R.

Solution A. Dissolve 6.0 mg of tetradecane R in hexane R and dilute to 10.0 ml with the same solvent.

Solution B. To 6.0 mg of diethylene glycol R in a 10 ml volumetric flask add 3 ml of *N*-methyltrimethylsilyl-trifluoroacetamide R and heat for 30 min at 50 °C. After cooling dilute to 10.0 ml with *N*-methyltrimethylsilyl-trifluoroacetamide R.

Test solution. To 0.200 g of the substance to be examined add 10 µl of solution A. Add 2 ml of *N*-methyltrimethylsilyl-trifluoroacetamide R and heat for 30 min at 50 °C.

Reference solution. To 2.0 ml of *N*-methyltrimethylsilyl-trifluoroacetamide R add 10 µl of solution A and 10 µl of solution B.

Column:

- size: $l = 25$ m, $\varnothing = 0.20$ mm,
- stationary phase: poly(dimethyl)(diphenyl)siloxane R (film thickness 0.33 µm).

Carrier gas: hydrogen for chromatography R.

Flow rate: 0.9 ml/min.

Temperature:

	Time (min)	Temperature (°C)	Rate (°C/min)
Column	0 - 13	60 → 150	7
	13 - 19	150 → 300	25
	19 - 34	300	
Injection port		150	
Detector		300	

Detection: flame ionisation.

Injection: 0.2 µl.

Limit:

- impurity F: maximum 0.1 per cent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 30 ml of methanol R and dilute to 50.0 ml with water R.

Reference solution (a). Dissolve 10.0 mg of etofenamate impurity G CRS in methanol R and dilute to 20.0 ml with the same solvent. Dilute 0.2 ml of the solution to 50.0 ml with a mixture of 40 volumes of water R and 60 volumes of methanol R.

Reference solution (b). Dilute 0.2 ml of the test solution to 100.0 ml with a mixture of 40 volumes of water R and 60 volumes of methanol R.

Reference solution (c). To 5.0 ml of reference solution (a), add 5.0 ml of reference solution (b).

Reference solution (d). Dissolve 10.0 mg of etofenamate for peak identification CRS (contains etofenamate spiked with about 1 per cent of impurities A, B, C, D and E) in 6.0 ml of methanol R and dilute to 10.0 ml with water R.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.0$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (3 µm),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: dissolve 1.3 g of ammonium phosphate R and 4.0 g of tetrabutylammonium hydroxide R in 900 ml of water R. Adjust the pH to 8.0 with dilute phosphoric acid R and dilute to 1000 ml with water R,
- mobile phase B: methanol R,

Time	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	40	60
13 - 20	40 → 10	60 → 90
20 - 25	10	90
25 - 26	10 → 40	90 → 60
26 - 31	40	60

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 286 nm.

Injection: 20 µl.

Relative retention with reference to etofenamate (retention time = about 13 min): impurity A = about 0.2; impurity C = about 0.7; impurity G = about 0.85; impurity E = about 1.5; impurity B = about 1.6; impurity D = about 1.7.

System suitability: reference solution (c):

- resolution: minimum of 2.3 between the peaks due to impurity G and to etofenamate.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.62; impurity C = 0.45; impurity D = 0.77,
- impurity A: not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- impurity B: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- impurity C: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- impurity D: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

01/2005:0492

- **impurity E**: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **impurity G**: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **any other impurity**: not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total**: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.2 per cent),
- **disregard limit**: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 3.000 g add 20 ml of *2-propanol* R and 20.0 ml of *1 M sodium hydroxide* and heat under reflux for 2 h. Add 0.1 ml of *bromothymol blue solution* R1. Titrate after cooling with *1 M hydrochloric acid* until the colour disappears. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.3694 g of $C_{18}H_{18}F_3NO_4$.

IMPURITIES

- A. R = CO_2H : 2-[[3-(trifluoromethyl)phenyl]amino]benzoic acid (flufenamic acid),
- B. R = $CO-O-C_4H_9$: butyl 2-[[3-(trifluoromethyl)phenyl]amino]benzoate (butyl flufenamate),
- C. R = H: *N*-phenyl-3-(trifluoromethyl)aniline,
- E. R = $CO-[O-CH_2-CH_2]_3-CH_2-CH_3$: 2-(2-butoxyethoxy)ethyl 2-[[3-(trifluoromethyl)phenyl]amino]benzoate,
- G. R = $CO-O-CH_2-CH_2-OH$: 2-hydroxyethyl 2-[[3-(trifluoromethyl)phenyl]amino]benzoate,

- D. 2,2'-oxybis(ethylene) bis[2-[[3-(trifluoromethyl)phenyl]amino]benzoate],

- F. 2,2'-oxydiethanol.

ETOFYLLINE

Etofyllinum

$C_9H_{12}N_4O_3$

M_r 224.2

DEFINITION

Etofylline contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7-(2-hydroxyethyl)-1,3-dimethyl-3,7-dihydro-1H-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- A. Melting point (2.2.14): 161 °C to 166 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *etofylline CRS*. Examine the substances as discs prepared using 0.5 mg to 1 mg of the substance to be examined in 0.3 g of *potassium bromide* R.
- C. Dissolve 1 g in 5 ml of *acetic anhydride* R and boil under a reflux condenser for 15 min. Allow to cool and add 100 ml of a mixture of 20 volumes of *ether* R and 80 volumes of *light petroleum* R. Cool in iced water for at least 20 min, shaking from time to time. Filter, wash the precipitate with a mixture of 20 volumes of *ether* R and 80 volumes of *light petroleum* R, recrystallise from *alcohol* R and dry *in vacuo*. The crystals melt (2.2.14) at 101 °C to 105 °C.
- D. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water* R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.25 ml of *bromothymol blue solution* R1. The solution is yellow or green. Not more than 0.4 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel* HF_{254} R as the coating substance.

Test solution. Dissolve 0.3 g of the substance to be examined in a mixture of 20 volumes of *water* R and 30 volumes of *methanol* R and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol* R.

Reference solution (b). Dilute 0.2 ml of the test solution to 100 ml with *methanol* R.

Reference solution (c). Dissolve 10 mg of *theophylline R* in *methanol R*, add 0.3 ml of the test solution and dilute to 10 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 10 volumes of *ethanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (400 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in 3.0 ml of *anhydrous formic acid R* and add 50.0 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.42 mg of C₉H₁₂N₄O₃.

STORAGE

Store protected from light.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *etomidate CRS*.
- It complies with the test for specific optical rotation (see Tests).

TESTS

Solution S. Dissolve 0.25 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7): + 67 to + 70, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of 50 volumes of *ethanol R* and 50 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *etomidate CRS* and 5.0 mg of *etomidate impurity B CRS* in a mixture of 50 volumes of *ethanol R* and 50 volumes of *water R* and dilute to 250.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 50 volumes of *ethanol R* and 50 volumes of *water R*. Dilute 5.0 ml of the solution to 25.0 ml with a mixture of 50 volumes of *ethanol R* and 50 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 2.0 ml/min, the following linear gradient programme:

Mobile phase A. A 5 g/l solution of *ammonium carbonate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 5	90 → 30	10 → 70	linear gradient
5 - 6	30 → 10	70 → 90	linear gradient
6 - 10	10	90	isocratic
10 - 11	10 → 90	90 → 10	linear gradient
11 - 15	90	10	re-equilibration

- as detector a spectrophotometer set at 235 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: impurity B about 4.5 min; etomidate about 5.0 min. The test is not valid unless the resolution between the peaks due to impurity B and etomidate is at least 5.0. If necessary, adjust the concentration of *ammonium carbonate R* in the mobile phase or the time programme of the linear gradient.

01/2005:1514

ETOMIDATE

Etomidatum

C₁₄H₁₆N₂O₂

*M*_r 244.3

DEFINITION

Etomidate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of ethyl 1-[(1*R*)-1-phenylethyl]-1*H*-imidazole-5-carboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, freely soluble in alcohol and in methylene chloride. It melts at about 68 °C.

Inject 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 40 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 24.43 mg of $C_{14}H_{16}N_2O_2$.

STORAGE

Protected from light.

IMPURITIES

- A. R = H: 1-[(1*RS*)-1-phenylethyl]-1*H*-imidazole-5-carboxylic acid,
- B. R = CH₃: methyl 1-[(1*RS*)-1-phenylethyl]-1*H*-imidazole-5-carboxylate (metomidate),
- C. R = CH(CH₃)₂: 1-methylethyl 1-[(1*RS*)-1-phenylethyl]-1*H*-imidazole-5-carboxylate.

01/2005:0823

ETOPOSIDE

Etoposidum

$C_{29}H_{32}O_{13}$

M_r 588.6

DEFINITION

(5*R*,5*aR*,8*aR*,9*S*)-9-[[4,6-*O*[(*R*)-Ethylidene]-β-*D*-glucopyranosyl]oxy]-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one.

Content: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in methanol, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *etoposide CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 2 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *etoposide CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 2 ml with the same mixture of solvents.

Plate: plate with *silica gel H R* as coating substance.

Mobile phase: *water R*, *glacial acetic acid R*, *acetone R*, *methylene chloride R* (1.5:8:20:100 V/V/V/V).

Application: 5 µl as 10 mm bands.

Development: immediately, over a path of 17 cm.

Drying: in a current of warm air for 5 min.

Detection: spray with a mixture of 1 volume of *sulphuric acid R* and 9 volumes of *alcohol R* and heat at 140 °C for 15 min. Cover the plate immediately with a glass plate of the same size. Examine in daylight.

Results: the principal band in the chromatogram obtained with the test solution is similar in position, colour and size to the principal band in the chromatogram obtained with the reference solution.

D. In a test-tube dissolve about 5 mg in 5 ml of *glacial acetic acid R* and add 0.05 ml of *ferric chloride solution R1*. Mix and cautiously add 2 ml of *sulphuric acid R*. Avoid mixing the 2 layers. Allow to stand for about 30 min; a pink to reddish-brown ring develops at the interface and the upper layer is yellow.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, *Method II*).

Dissolve 0.6 g in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Specific optical rotation (2.2.7): –106 to –114 (anhydrous substance).

Dissolve 50 mg in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10.0 ml with the same mixture of solvents.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 40 mg of the substance to be examined in a mixture of equal volumes of mobile phase A and mobile phase B and dilute to 10.0 ml with the same mixture of mobile phases.

Figure 0823.-1. – Chromatogram for the test for related substances of etoposide

Test solution (b). Dissolve 50.0 mg of the substance to be examined in a mixture of equal volumes of mobile phase A and mobile phase B and dilute to 50.0 ml with the same mixture of mobile phases.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 10.0 ml with a mixture of equal volumes of mobile phase A and mobile phase B. Dilute 1.0 ml of this solution to 20.0 ml with a mixture of equal volumes of mobile phase A and mobile phase B.

Reference solution (b). Dilute 4.0 ml of reference solution (a) to 10.0 ml with a mixture of equal volumes of mobile phase A and mobile phase B.

Reference solution (c). Dissolve 50.0 mg of *etoposide CRS* in a mixture of equal volumes of mobile phase A and mobile phase B and dilute to 50.0 ml with the same mixture of mobile phases.

Reference solution (d). To 10 ml of test solution (b), add 0.1 ml of a 4 per cent V/V solution of *glacial acetic acid R* and 0.1 ml of *phenolphthalein solution R*. Add 1 M *sodium hydroxide* until the solution becomes faintly pink (about 0.15 ml). After 15 min, add 0.1 ml of a 4 per cent V/V solution of *glacial acetic acid R*.

Column:

- size: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 μ m),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: *triethylamine R*, *anhydrous formic acid R*, *water R* (1:1:998 V/V/V),
- mobile phase B: *triethylamine R*, *anhydrous formic acid R*, *acetonitrile R* (1:1:998 V/V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 7	75	25
7 - 23	75 → 27	25 → 73
23 - 25	27 → 75	73 → 25
25 - 40	75	25

Flow rate: 1 ml/min.

Detection: spectrophotometer at 285 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (a), (b) and (d).

Retention times: the retention times and the elution order of the peaks are similar to those shown in the chromatogram (Figure 0823.-1).

System suitability: reference solution (d): continue the chromatography until the peak due to phenolphthalein is eluted.

- the chromatogram shows 2 principal peaks corresponding to etoposide and to impurity B. Disregard any peak due to phenolphthalein.

Figure 0823.-2. – Chromatogram for the test for related substances of etoposide: reference solution (d)

- **resolution**: minimum 3.0 between the peaks due to etoposide and to impurity B.

If necessary, increase slightly the proportion of mobile phase A during the isocratic phase of the gradient. When the chromatograms are recorded under the prescribed conditions, the retention times of the peaks in the chromatogram obtained with reference solution (d) are similar to those shown in the chromatogram (Figure 0823.-2).

Limits:

- **any impurity**: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than 2 such peaks have an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **total**: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent),
- **disregard limit**: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a). Disregard any peak due to the solvent.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 6.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: test solution (b) and reference solution (c).

System suitability:

- **repeatability**: maximum relative standard deviation of 1.0 per cent after 6 injections of reference solution (c).

Calculate the percentage content of $C_{29}H_{32}O_{13}$ from the areas of the peaks and the declared content of *etoposide CRS*.

STORAGE

In an airtight container.

IMPURITIES

A. (5*R*,5*aR*,8*aR*,9*S*)-5-[4-[(benzyloxy)carbonyl]oxy]-3,5-dimethoxyphenyl]-9-[[4,6-*O*-[(*R*)-ethylidene]-β-D-glucopyranosyl]oxy]-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (4'-carbobenzoyloxyethylidene-lignan P),

B. (5*R*,5*aS*,8*aR*,9*S*)-9-[[4,6-*O*-[(*R*)-ethylidene]-β-D-glucopyranosyl]oxy]-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (picroethylidene-lignan P; *cis*-etoposide),

C. (5*R*,5*aR*,8*aR*,9*S*)-9-[[4,6-*O*-[(*R*)-ethylidene]-α-D-glucopyranosyl]oxy]-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (α-etoposide),

D. (5*R*,5*aR*,8*aR*,9*S*)-9-(β-D-glucopyranosyloxy)-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (lignan P),

E. (5*R*,5*aR*,8*aR*,9*S*)-9-hydroxy-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (4'-demethylepipodophyllotoxin),

F. (5*R*,5*aR*,8*aR*,9*S*)-9-[[4,6-*O*-[(*R*)-ethylidene]-β-D-glucopyranosyl]oxy]-5-[4-(phenoxyacetyl)oxy]-3,5-dimethoxyphenyl]-5,8,8*a*,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5*aH*)-one (4'-phenoxyacetyletoposide),

01/2005:1320

EUCALYPTUS LEAF

Eucalypti folium

DEFINITION

Eucalyptus leaf consists of the whole or cut dried leaves of older branches of *Eucalyptus globulus* Labill. The whole drug contains not less than 20 ml/kg of essential oil and the cut drug not less than 15 ml/kg of essential oil, both calculated with reference to the anhydrous drug.

CHARACTERS

The drug has an aromatic odour of cineole.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaves which are mainly greyish-green and relatively thick are elongated, elliptical and slightly sickle-shaped and usually up to 25 cm in length, and up to 5 cm in width. The petiole is twisted, strongly wrinkled and is 2 cm to 3 cm, rarely 5 cm, in length. The coriaceous, stiff leaves are entire and glabrous and have a yellowish-green mid-rib. Lateral veins anastomose near the margin to a continuous line. The margin is even and somewhat thickened. On both surfaces are minute, irregularly distributed, warty dark brown spots. Small oil glands may be seen in transmitted light.
- B. Reduce to a powder (355). The powder is greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows fragments of glabrous

lamina with small thick-walled epidermal cells bearing a thick cuticle, numerous anomocytic stomata (2.8.3) of more than 80 µm in diameter and occasionally groups of brown cork cells, 300 µm in diameter and brownish-black in their centre; fragments of isobilateral mesophyll with two or three layers of palisade parenchyma on each side and in the centre several layers of spongy mesophyll with elongated cells with the same orientation as the palisade cells and containing prisms and cluster crystals of calcium oxalate; fragments of mesophyll containing large schizogenous oil glands.

- C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Shake 0.5 g of the freshly powdered drug (355) with 5 ml of *toluene R* for 2 min to 3 min and filter over about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 50 µl of *cineole R* in *toluene R* and dilute to 5 ml with the same solvent.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *ethyl acetate R* and 90 volumes of *toluene R*. Allow the plate to dry in air and spray the plate with *anisaldehyde solution R*. Examine in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The chromatogram obtained with the reference solution shows in the middle a zone corresponding to cineole. The main zone in the chromatogram obtained with the test solution is similar in position and colour to the zone corresponding to cineole in the chromatogram obtained with the reference solution, it also shows an intense violet zone (hydrocarbons) near the solvent front and there may also be other fainter zones.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent of dark and brown leaves, not more than 5 per cent of stems and not more than 2 per cent of other foreign matter. Cordate or ovate sessile leaves of young branches, with numerous glands on both sides, visible as points in transmitted light, are not present. Determine by using 30 g of the drug.

Water (2.2.13). Not more than 100 ml/kg, determined on 20.0 g of powdered drug (355) by distillation.

Total ash (2.4.16). Not more than 6.0 per cent.

ASSAY

Carry out the determination of essential oil in vegetable drugs (2.8.12). Use 10.0 g of the cut drug immediately before determination, a 500 ml round-bottomed flask, 200 ml of *water R* and 100 ml of *glycerol R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

STORAGE

Store protected from light.

01/2005:0390

EUCALYPTUS OIL

Eucalypti aetheroleum

DEFINITION

Eucalyptus oil is obtained by steam distillation and rectification from the fresh leaves or the fresh terminal branchlets of various species of *Eucalyptus* rich in 1,8-cineole. The species mainly used are *Eucalyptus globulus* Labill., *Eucalyptus polybractea* R.T. Baker and *Eucalyptus smithii* R.T. Baker.

CHARACTERS

A colourless or pale yellow liquid with an aromatic and camphoraceous odour and a pungent and camphoraceous taste.

IDENTIFICATION

First identification: B.

Second identification: A.

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 µl of *cineole R* in *toluene R* and dilute to 5 ml with the same solvent.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *ethyl acetate R* and 90 volumes of *toluene R*. Allow the plate to dry in air and spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min. The chromatogram obtained with the reference solution shows in the middle a zone due to cineole. The chromatogram obtained with the test solution shows a main zone similar in position and colour to the zone due to cineole in the chromatogram obtained with the reference solution. Other weaker zones may be present.

- B. Examine the chromatograms obtained in the test for chromatographic profile. The chromatogram obtained with the test solution shows 5 peaks similar in retention time to the 5 peaks in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.906 to 0.927.

Refractive index (2.2.6): 1.458 to 1.470.

Optical rotation (2.2.7): 0° to + 10°.

Solubility in alcohol (2.8.10). It is soluble in 5 volumes of *ethanol* (70 per cent V/V) *R*.

Aldehydes. Place 10 ml in a glass-stoppered tube 25 mm in diameter and 150 mm long. Add 5 ml of *toluene R* and 4 ml of *alcoholic hydroxylamine solution R*. Shake vigorously and titrate immediately with 0.5 M *potassium hydroxide in alcohol* (60 per cent V/V) until the red colour changes to yellow. Continue the titration with shaking; the end-point is reached when the pure yellow colour of the indicator is permanent in the lower layer after shaking vigorously for 2 min and allowing separation to take place. The reaction is complete in about 15 min. Repeat the titration using a further 10 ml of the substance to be examined and, as a reference solution for the end-point, the titrated liquid from the first determination to which has been added 0.5 ml of 0.5 M *potassium hydroxide in alcohol* (60 per cent V/V). Not more than 2.0 ml of 0.5 M *potassium hydroxide in alcohol* (60 per cent V/V) is required in the second titration.

Chromatographic profile. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. Dissolve 80 µl of *α-pinene R*, 10 µl of *β-pinene R*, 10 µl of *α-phellandrene R*, 10 µl of *limonene R*, 0.8 ml of *cineole R* and 10 mg of *camphor R* in 10 ml of *acetone R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 60 m long and about 0.25 mm in internal diameter coated with *macrogol 20 000 R* as the bonded phase,

- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

maintaining the temperature of the column at 60 °C for 5 min, then raising the temperature at a rate of 5 °C/min to 200 °C and maintaining at 200 °C for 5 min; maintaining the temperature of the injection port and that of the detector at 220 °C.

Inject about 0.5 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions the components elute in the order indicated in the composition of the reference solution. Record the retention times of these substances.

The assay is not valid unless: the number of theoretical plates calculated for the peak due to limonene at 110 °C is at least 30 000; the resolution between the peaks corresponding to limonene and cineole is at least 1.5.

Inject about 0.5 µl of the test solution. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Determine the percentage content of these components by the normalisation procedure.

The percentages are within the following ranges:

- *α-pinene*: traces to 9.0 per cent,
- *β-pinene*: less than 1.5 per cent,
- *α-phellandrene*: less than 1.5 per cent,
- *limonene*: traces to 12.0 per cent,
- *1,8-cineole*: minimum 70.0 per cent,
- *camphor*: less than 0.1 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2005:1100

EUGENOL

Eugenolum

C₁₀H₁₂O₂

*M*_r 164.2

DEFINITION

Eugenol is 2-methoxy-4-(prop-2-enyl)phenol.

CHARACTERS

A colourless or pale yellow, clear liquid, darkening on exposure to air, with a strong odour of clove, practically insoluble in water, freely soluble in alcohol (70 per cent V/V), practically insoluble in glycerol, miscible with glacial acetic acid, with alcohol, with fatty oils and with methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. It complies with the test for refractive index (see Tests).

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *eugenol CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 50 µl of the substance to be examined in *alcohol R* and dilute to 25 ml with the same solvent.

Reference solution. Dissolve 50 µl of *eugenol CRS* in *alcohol R* and dilute to 25 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *ethyl acetate R* and 90 volumes of *toluene R*. Dry the plate in a current of cold air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dissolve 0.05 ml in 2 ml of *alcohol R* and add 0.1 ml of *ferric chloride solution R1*. A dark green colour is produced which changes to yellowish-green within 10 min.

TESTS

Relative density (2.2.5): 1.066 to 1.070.

Refractive index (2.2.6): 1.540 to 1.542.

Dimeric and oligomeric compounds. Dissolve 0.150 g of the substance to be examined in *ethanol R* and dilute to 100.0 ml with the same solvent. The absorbance of the solution (2.2.25) at 330 nm is not greater than 0.25.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 1.00 g of the substance to be examined in *ethanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *ethanol R*.

Reference solution (b). Dissolve 50 mg of *vanillin R* in 1 ml of the test solution and dilute to 5 ml with *ethanol R*.

The chromatographic procedure may be carried out using:

- a fused-silica capillary column 30 m long and 0.25 mm in internal diameter coated with a film of *polymethylphenylsiloxane R* (film thickness 0.25 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 1 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:40,

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 2	80		isothermal
	2 - 27	80 → 280	8	linear gradient
	27 - 47	280		isothermal
Injection port		250		
Detector		280		

Inject 1 µl of the test solution and 1 µl each of reference solutions (a) and (b). The test is not valid unless in the chromatogram obtained with reference solution (b), the relative retention time of the peak due to vanillin is at least 1.1 with respect to the peak due to eugenol. Calculate the percentage content of related substances from the areas

of the peaks in the chromatogram obtained with the test solution by the normalisation procedure; disregard the solvent peak and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a). The content of related substances with a relative retention time greater than 2.0 in respect to the main peak is not greater than 1.0 per cent; the content of any related substances is not greater than 0.5 per cent; the total content of related substances is not greater than 3.0 per cent.

Hydrocarbons. Dissolve 1 ml in 5 ml of *dilute sodium hydroxide solution R* and add 30 ml of *water R* in a stoppered test-tube. Examined immediately, the solution is yellow and clear (2.2.1).

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

STORAGE

Store in a well-filled container, protected from light.

IMPURITIES

- A. (1*R*,4*E*,9*S*)-4,11,11-trimethyl-8-methylenebicyclo[7.2.0]undec-4-ene (β -caryophyllene),

- B. (1*E*,4*E*,8*E*)-2,6,6,9-tetramethylcycloundeca-1,4,8-triene (α -humulene, α -caryophyllene),

- C. (1*R*,4*R*,6*R*,10*S*)-4,12,12-trimethyl-9-methylene-5-oxatricyclo[8.2.0.0^{4,6}]dodecane (β -caryophyllene oxide),

- D. R1 = H, R2 = H, R3 = CH₂-CH=CH₂: 4-(prop-2-enyl)phenol,

- E. R1 = CH₃, R2 = OCH₃, R3 = CH₂-CH=CH₂: 1,2-dimethoxy-4-(prop-2-enyl)benzene (eugenol methyl ether),

- F. R1 = H, R2 = OCH₃, R3 = CH=CH-CH₃ (*cis*): 2-methoxy-4-[(*Z*)-prop-1-enyl]phenol (*cis*-isoeugenol),

- G. R1 = H, R2 = OCH₃, R3 = CH=CH-CH₃ (*trans*): 2-methoxy-4-[(*E*)-prop-1-enyl]phenol (*trans*-isoeugenol),

- H. R1 = H, R2 = OCH₃, R3 = CHO: 4-hydroxy-3-methoxybenzaldehyde (vanillin),

- I. R1 = CO-CH₃, R2 = OCH₃, R3 = CH₂-CH=CH₂: 2-methoxy-4-(prop-2-enyl)phenyl acetate (acetyleneugenol),

- J. R1 = H, R2 = OCH₃, R3 = CO-CH=CH₂: 1-(4-hydroxy-3-methoxyphenyl)prop-2-enone,

- K. R1 = H, R2 = OCH₃, R3 = CH=CH-CHO: (*E*)-3-(4-hydroxy-3-methoxyphenyl)prop-2-enal (*trans*-coniferyl aldehyde),

- L. 2-methoxy-4-[3-methyl-5-(prop-2-enyl)-2,3-dihydrobenzofuran-2-yl]phenol (dehydrodiisoeugenol),

- M. 3,3'-dimethoxy-5,5'-bis(prop-2-enyl)biphenyl-2,2'-diol (dehydrodieugenol),

- N. O. two further unknown dimeric compounds,

- P. toluene.

01/2005:1012

FAMOTIDINE

Famotidinum

 $C_8H_{15}N_7O_2S_3$ M_r 337.5

DEFINITION

3-[[[2-[(Diaminomethylene)amino]thiazol-4-yl]methyl]sulphonyl]-N'-sulphamoylpropanimidamide.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder or crystals.

Solubility: very slightly soluble in water, freely soluble in glacial acetic acid, very slightly soluble in anhydrous ethanol, practically insoluble in ethyl acetate. It dissolves in dilute mineral acids.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: famotidine CRS.

If the spectra obtained show differences, suspend 0.10 g of the substance to be examined and 0.10 g of the reference substance separately in 5 ml of *water R*. Heat to boiling and allow to cool, scratching the wall of the tube with a glass rod to initiate crystallisation. Filter, wash the crystals with 2 ml of iced *water R* and dry in an oven at 80 °C at a pressure not exceeding 670 Pa for 1 h. Record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 0.20 g in a 50 g/l solution of *hydrochloric acid R*, heating to 40 °C if necessary, and dilute to 20 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 12.5 mg of the substance to be examined in mobile phase A and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 2.5 mg of *famotidine impurity D CRS* in *methanol R* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution add 0.50 ml of the test solution and dilute to 100.0 ml with mobile phase A.

Reference solution (c). Dissolve 5.0 mg of *famotidine for system suitability CRS* (famotidine containing impurities A, B, C, D, E, F, G) in mobile phase A and dilute to 10.0 ml with mobile phase A.

Column:

– *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,

– *stationary phase*: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm),

– *temperature*: 50 °C.

Mobile phase:

– *mobile phase A*: mix 6 volumes of *methanol R*, 94 volumes of *acetonitrile R* and 900 volumes of a 1.882 g/l solution of *sodium hexanesulphonate R* previously adjusted to pH 3.5 with *acetic acid R*,

– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Flow rate (ml/min)
0 - 23	100 → 96	0 → 4	1
23 - 27	96	4	1 → 2
27 - 47	96 → 78	4 → 22	2
47 - 48	78 → 100	22 → 0	2
48 - 54	100	0	2 → 1

Detection: spectrophotometer at 265 nm.

Injection: 20 µl.

Relative retention with reference to famotidine (retention time = about 21 min): impurity D = about 1.1; impurity C = about 1.2; impurity G = about 1.4; impurity F = about 1.5; impurity A = about 1.6; impurity B = about 2.0; impurity E = about 2.1.

System suitability:

- the chromatogram obtained with reference solution (c) is similar to the chromatogram supplied with *famotidine for system suitability CRS*;
- *retention time*: famotidine = 19-23 min in all the chromatograms; impurity E = maximum 48 min in the chromatogram obtained with reference solution (c);
- *resolution*: minimum 3.5 between the peaks due to famotidine and impurity D in the chromatogram obtained with reference solution (b).

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.9; impurity B = 2.5; impurity C = 1.9; impurity F = 1.7; impurity G = 1.4;
- *impurities A, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurities B, C, D, E*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), and not more than 3 such peaks have an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *impurity F*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) for the peaks eluting by 25 min, and not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) for the peaks eluting after 25 min (0.1 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a).

01/2005:1013

Heavy metals (2.4.8): maximum 10 ppm.2.0 g complies with limit test D. Prepare the reference solution using 2 ml of *lead standard solution* (10 ppm Pb) R.**Loss on drying** (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 80 °C at a pressure not exceeding 670 Pa for 5 h.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.**ASSAY**Dissolve 0.120 g in 60 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).1 ml of 0.1 M *perchloric acid* is equivalent to 16.87 mg of C₈H₁₅N₇O₂S₃.**STORAGE**

Protected from light.

IMPURITIES*Specified impurities: A, B, C, D, E, F, G.*A. R = NH₂, X = NH: 3-[[[2-[(diaminomethylene)amino]thiazol-4-yl]methyl]sulphanyl]propanimidamide,C. FELODIPINE**Felodipinum**C₁₈H₁₉Cl₂NO₄M_r 384.3**DEFINITION**Felodipine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of ethyl methyl (4*RS*)-4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate, calculated with reference to the dried substance.**CHARACTERS**

A white or light yellow, crystalline powder, practically insoluble in water, freely soluble in acetone, in ethanol, in methanol and in methylene chloride.

IDENTIFICATION*First identification: B.**Second identification: A, C, D.*A. Dissolve 50 mg in *methanol* R and dilute to 100 ml with the same solvent. Dilute 3 ml to 100 ml with *methanol* R. Examined between 220 nm and 400 nm (2.2.25), the solution shows two absorption maxima, at 238 nm and 361 nm. The ratio of the absorbance measured at the maximum at 361 nm to that measured at the maximum at 238 nm is 0.34 to 0.36.B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *felodipine CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol* R and dilute to 10 ml with the same solvent.*Reference solution (a).* Dissolve 10 mg of *felodipine CRS* in *methanol* R and dilute to 10 ml with the same solvent.*Reference solution (b).* Dissolve 5 mg of *nifedipine CRS* in reference solution (a) and dilute to 5 ml with the same solution.Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 40 volumes of *ethyl acetate* R and 60 volumes of *cyclohexane* R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. Dissolve 150 mg in a mixture of 25 ml of *2-methyl-2-propanol R* and 25 ml of *perchloric acid solution R*. Add 10 ml of *0.1 M cerium sulphate*, allow to stand for 15 min, add 3.5 ml of *strong sodium hydroxide solution R* and neutralise with *dilute sodium hydroxide solution R*. Shake with 25 ml of *methylene chloride R*. Evaporate the lower layer to dryness on a water-bath under nitrogen (the residue is also used in the test for related substances). Dissolve about 20 mg of the residue in *methanol R* and dilute to 50 ml with the same solvent. Dilute 2 ml to 50 ml with *methanol R*. Examined between 220 nm and 400 nm (2.2.25), the solution shows an absorption maximum at 273 nm.

TESTS

Solution S. Dissolve 1.00 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Absorbance (2.2.25). The absorbance of solution S at 440 nm is not greater than 0.10.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 50.0 mg of the residue obtained in identification test D (impurity A) and 25.0 mg of *felodipine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m to 0.15 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *methanol R*, 40 volumes of *acetonitrile R* and 40 volumes of a phosphate buffer solution pH 3.0, containing 0.8 g/l of *phosphoric acid R* and 8 g/l of *sodium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the two peaks are not less than 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (impurity A) and the second peak (felodipine) is at least 2.5. Two other peaks may be observed corresponding to impurity B and impurity C. The substances elute in the following order: impurity B, impurity A, felodipine and impurity C.

Inject 20 µl of the test solution, 20 µl of reference solution (a) and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of felodipine, which is about 12 min. In the chromatogram obtained with the test solution: the sum of the areas of any peaks corresponding to impurity B and impurity C is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); the area of any peak apart from the principal peak and any peaks corresponding to impurity B and impurity C is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the

sum of the areas of such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Disregard any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in a mixture of 25 ml of *2-methyl-2-propanol R* and 25 ml of *perchloric acid solution R*. Add 0.05 ml of *ferroin R*. Titrate with *0.1 M cerium sulphate* until the pink colour disappears. Titrate slowly towards the end of the titration.

1 ml of *0.1 M cerium sulphate* is equivalent to 19.21 mg of $C_{18}H_{19}Cl_2NO_4$.

STORAGE

Store protected from light.

IMPURITIES

A. ethyl methyl 4-(2,3-dichlorophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate,

B. R = CH₃: dimethyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,

C. R = C₂H₅: diethyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate.

01/2005:1208

FENBENDAZOLE FOR VETERINARY USE

Fenbendazolum ad usum veterinarium

$C_{15}H_{13}N_3O_2S$

M_r 299.4

DEFINITION

Fenbendazole for veterinary use contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of methyl [5-(phenylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, sparingly soluble in dimethylformamide, very slightly soluble in methanol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fenbendazole CRS*. Examine the substances prepared as discs.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 10.0 ml of *hydrochloric methanol R*.

Reference solution (a). Dissolve 50.0 mg of *fenbendazole CRS* in 10.0 ml of *hydrochloric methanol R*. Dilute 1.0 ml of this solution to 200.0 ml with *methanol R*. Dilute 5.0 ml of this second solution to 10.0 ml with *hydrochloric methanol R*.

Reference solution (b). Dissolve 10.0 mg of *fenbendazole impurity A CRS* in 100.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *hydrochloric methanol R*.

Reference solution (c). Dissolve 10.0 mg of *fenbendazole impurity B CRS* in 100.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *hydrochloric methanol R*.

Reference solution (d). Dissolve 10.0 mg of *fenbendazole CRS* and 10.0 mg of *mebendazole CRS* in 100.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *hydrochloric methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. Mix 1 volume of *anhydrous acetic acid R*, 30 volumes of *methanol R* and 70 volumes of *water R*,

Mobile phase B. Mix 1 volume of *anhydrous acetic acid R*, 30 volumes of *water R* and 70 volumes of *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	100 → 0	0 → 100	linear gradient
10 - 40	0	100	isocratic
40 - 50	0 → 100	100 → 0	re-equilibration

- as detector a spectrophotometer set at 280 nm.

When the chromatograms are recorded in the prescribed conditions, the retention time for fenbendazole is about 19 min. Inject separately 10 µl of each solution. The test is not valid unless, in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to fenbendazole and mebendazole is at least 1.5.

In the chromatogram obtained with the test solution: the area of the peaks corresponding to impurity A and impurity B is not greater than 2.5 times the area of the corresponding peak in the chromatograms obtained with reference

solution (b) and reference solution (c) (0.5 per cent); the area of any peak, apart from the principal peak and the peaks corresponding to impurity A and impurity B respectively, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.3 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 30 ml of *anhydrous acetic acid R*, warming gently if necessary. Cool and titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 29.94 mg of C₁₅H₁₃N₃O₂S.

STORAGE

Protected from light.

IMPURITIES

A. R = H: methyl (1*H*-benzimidazol-2-yl)carbamate,

B. R = Cl: methyl (5-chloro-1*H*-benzimidazol-2-yl)carbamate.

01/2005:1209

FENBUFEN

Fenbufenum

C₁₆H₁₄O₃M_r 254.3

DEFINITION

Fenbufen contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-(biphenyl-4-yl)-4-oxobutanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, fine, crystalline powder, very slightly soluble in water, slightly soluble in acetone, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Melting point (2.2.14): 186 °C to 189 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fenbufen CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *fenbufen CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *ketoprofen CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent. To 5 ml of the solution, add 5 ml of reference solution (a).

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *anhydrous acetic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *hexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 40 volumes of *dimethylformamide R* and 60 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 0.5 ml of the test solution to 50.0 ml with a mixture of 40 volumes of *dimethylformamide R* and 60 volumes of mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with a mixture of 40 volumes of *dimethylformamide R* and 60 volumes of mobile phase A.

Reference solution (b). Dissolve 25 mg of *fenbufen CRS* and 6 mg of *ketoprofen CRS* in a mixture of 40 volumes of *dimethylformamide R* and 60 volumes of mobile phase A and dilute to 10 ml with the same mixture of solvents. Dilute 1 ml of the solution to 100 ml with a mixture of 40 volumes of *dimethylformamide R* and 60 volumes of mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min the following solutions:

Mobile phase A. 32 volumes of *acetonitrile R* and 68 volumes of a mixture of 1 volume of *glacial acetic acid R* and 55 volumes of *water R*,

Mobile phase B. 45 volumes of *acetonitrile R* and 55 volumes of a mixture of 1 volume of *glacial acetic acid R* and 55 volumes of *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 – 15	100	0	isocratic
15 – 20	100 → 0	0 → 100	linear gradient
20 – 35	0	100	isocratic
35 – 40	0 → 100	100 → 0	linear gradient
40 – 45	100	0	re-equilibration

– as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (a) and 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to ketoprofen and to fenbufen is at least 5.0.

Inject 20 µl of the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of any peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 75 ml of *acetone R* previously neutralised with *phenolphthalein solution R1* and add 50 ml of *water R*. Add 0.2 ml of *phenolphthalein solution R1* and titrate with 0.1 M *sodium hydroxide*. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

IMPURITIES

A. 3-(4-chlorophenyl)-3-oxopropanoic acid,

B. R = CO-CH=CH-CO₂H, R' = H: 4-(biphenyl-4-yl)-4-oxobut-2-enoic acid,

C. R = R' = H: biphenyl,

D. R = CO-CH₂-CH₂-CO₂H, R' = OH: 4-(4'-hydroxybiphenyl-4-yl)-4-oxobutanoic acid.

01/2005:0824 TESTS

FENNEL, BITTER**Foeniculi amari fructus****DEFINITION**

Bitter fennel consists of the dry, cremocarps and mericarps of *Foeniculum vulgare* Miller sp. *vulgare* var. *vulgare*. It contains not less than 40 ml/kg of essential oil, calculated with reference to the anhydrous drug. The oil contains not less than 60.0 per cent of anethole and not less than 15.0 per cent of fenchone.

CHARACTERS

Bitter fennel is greenish-brown, brown or green.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The fruit of bitter fennel is a cremocarp, of almost cylindrical shape with a rounded base and a narrower summit crowned with a large stylopod. It is generally 3 mm to 12 mm long and 3 mm to 4 mm wide. The mericarps, usually free, are glabrous. Each bears five prominent slightly crenated ridges. When cut transversely, four vittae on the dorsal surface and two on the commissural surface may be seen with a lens.
- B. Reduce to a powder (355). The powder is greyish-brown to greyish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells, frequently associated with a layer of thin-walled transversely elongated cells 2 µm to 9 µm wide, having a parquetry arrangement; reticulate parenchyma of the mesocarp; numerous fibre bundles from the ridges, often accompanied by narrow spiral vessels; very numerous endosperm fragments containing aleurone grains and very small calcium oxalate microrosette crystals, as well as some fibre bundles from the carpophore.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Shake 0.3 g of the freshly powdered drug (1400) with 5.0 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R*.

Reference solution. Dissolve 50 µl of *anethole R* and 10 µl of *fenchone R* in 5.0 ml of *hexane R*.

Apply separately to the plate, as bands 20 mm by 3 mm, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *hexane R* and 80 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatograms show in the central part a quenching zone corresponding to anethole. Spray the plate with *sulphuric acid R* and heat at 140 °C for 5 min to 10 min until a yellow zone corresponding to fenchone appears in the lower third of the chromatograms. Anethole appears as a violet band in the central part. The chromatogram obtained with the test solution also shows a reddish-brown zone in its upper third (terpenes).

TESTS

Estragole. The essential oil obtained in the assay contains not more than 5.0 per cent of estragole.

Operate as described in the assay for anethole and fenchone, using the following reference solution.

Reference solution. Dissolve 5 mg of *estragole R* in 0.5 ml of *xylene R*.

Determine the content of estragole by normalisation.

Foreign matter (2.8.2). Not more than 1.5 per cent of peduncles and not more than 1.5 per cent of other foreign matter.

Water (2.2.13). Not more than 80 ml/kg, determined by distillation on 20.0 g of the powdered drug (710).

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) and immediately use 5.0 g for the determination. Introduce 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

Anethole and fenchone. Examine by gas chromatography (2.2.28).

Test solution. Dilute the mixture of essential oil and *xylene R* obtained in the determination of essential oil to 5.0 ml with *xylene R* and by rinsing the apparatus.

Reference solution. Dissolve 5 mg of *fenchone R* and 5 mg of *anethole R* in 0.5 ml of *xylene R*.

The chromatographic procedure may be carried out using:

- a capillary column 30 m to 60 m long and 0.3 mm in internal diameter coated with *macrogol 20 000 R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 0.40 ml/min and split at a ratio of 1 to 200,
- a flame-ionisation detector,

maintaining the temperature of the column at 60 °C for 4 min, then raising the temperature linearly at a rate of 5 °C per minute to 170 °C and maintaining at 170 °C for 15 min and maintaining the temperature of the injection port at 220 °C and that of the detector at 270 °C.

Inject 1 µl of the reference solution. Identify and record the retention times of the components, which are eluted in the order indicated in the composition of the reference solution.

Inject 1 µl of the test solution. Determine the contents of anethole and fenchone by normalisation.

STORAGE

Store protected from light and moisture.

01/2005:0825

FENNEL, SWEET**Foeniculi dulcis fructus****DEFINITION**

Sweet fennel consists of the dry, cremocarps and mericarps of *Foeniculum vulgare* Miller sp. *vulgare* var. *dulce* (Miller) Thellung. It contains not less than 20 ml/kg of essential oil, calculated with reference to the anhydrous drug. The oil contains not less than 80.0 per cent of anethole.

CHARACTERS

Sweet fennel is pale green or pale yellowish-brown.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The fruit of sweet fennel is a cremocarp of almost cylindrical shape with a rounded base and a narrowed summit crowned with a large stylopod. It is generally 3 mm to 12 mm long and 3 mm to 4 mm wide. The mericarps, usually free, are glabrous. Each bears five prominent slightly carenated ridges. When cut transversely, four vittae on the dorsal surface and two on the commissural surface may be seen with a lens.
- B. Reduce to a powder (355). The powder is greyish-brown to greyish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells, frequently associated with a layer of thin-walled transversely elongated cells 2 µm to 9 µm wide, having a parquetry arrangement; reticulate parenchyma of the mesocarp; numerous fibre bundles from the ridges, often accompanied by narrow spiral vessels; very numerous endosperm fragments containing aleurone grains and very small calcium oxalate microrosette crystals, as well as some fibre bundles from the carpophore.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Shake 0.3 g of the freshly powdered drug (1400) with 5.0 ml of *methylen chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R*.

Reference solution. Dissolve 60 µl of *anethole R* in 5.0 ml of *hexane R*.

Apply separately to the plate, as bands 20 mm by 3 mm, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *hexane R* and 80 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatograms show in the central part a quenching zone corresponding to anethole. Spray the plate with *sulphuric acid R* and heat at 140 °C for 5 min. Examine in daylight. The chromatograms show in the central part a violet band corresponding to anethole. The chromatogram obtained with the test solution also shows a reddish-brown zone in its upper third (terpenes).

TESTS

Estragole and fenchone. The essential oil obtained in the assay contains not more than 10.0 per cent of estragole and not more than 7.5 per cent of fenchone.

Proceed as described in the assay for anethole, using the following reference solution.

Reference solution. Dissolve 5 mg of *estragole R* and 5 mg of *fenchone R* in 0.5 ml of *xylene R*.

Determine the contents of estragole and fenchone by normalisation.

Foreign matter (2.8.2). Not more than 1.5 per cent of peduncles and not more than 1.5 per cent of other foreign matter.

Water (2.2.13). Not more than 80 ml/kg, determined by distillation on 20.0 g of the powdered drug (710).

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) and immediately use 10.0 g for the determination. Introduce 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

Anethole. Examine by gas chromatography (2.2.28).

Test solution. Dilute the mixture of essential oil and *xylene R* obtained in the determination of the essential oil to 5.0 ml with *xylene R* and by rinsing the apparatus.

Reference solution. Dissolve 5 mg of *anethole R* in 0.5 ml of *xylene R*.

The chromatographic procedure may be carried out using:

- a capillary column 30 m to 60 m long and 0.3 mm in internal diameter coated with *macrogol 20 000 R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 0.40 ml/min and split at a ratio of 1 to 200,
- a flame-ionisation detector,

maintaining the temperature of the column at 60 °C for 4 min, then raising the temperature linearly at a rate of 5 °C per minute to 170 °C and maintaining at 170 °C for 15 min and maintaining the temperature of the injection port at 220 °C and that of the detector at 270 °C.

Inject 1 µl of each solution. Determine the content of anethole by normalisation.

STORAGE

Store protected from light and moisture.

01/2005:1322

FENOFIBRATE

Fenofibratum

C₂₀H₂₁ClO₄

M_r 360.8

DEFINITION

Fenofibrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 1-methylethyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

- A. Melting point (2.2.14): 79 °C to 82 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fenofibrate CRS*. Examine the substances prepared as discs.

TESTS

Solution S. To 5.0 g, add 25 ml of *distilled water R* and heat at 50 °C for 10 min. Cool and dilute to 50.0 ml with the same solvent. Filter. Use the filtrate as solution S.

Appearance of solution. Dissolve 0.50 g in *acetone R* and dilute to 10.0 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity. Dissolve 1.0 g in 50 ml of *alcohol R* previously neutralised using 0.2 ml of *phenolphthalein solution R1*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained is at least 20 per cent of the full scale of the recorder. When the chromatograms are recorded in the prescribed conditions, the relative retention times are: impurity A about 0.34, impurity B about 0.36, impurity C about 0.50, impurity D about 0.65, impurity E about 0.80, impurity F about 0.85 and impurity G about 1.35. The test is not valid unless the resolution between the peaks corresponding to impurity A and impurity B is at least 1.5.

Inject 20 µl of reference solution (b) and 20 µl of the test solution. Continue the chromatography of the test solution for twice the retention time of fenofibrate. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity A, impurity B or impurity G is not greater than that of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent for impurities A and B and 0.2 per cent for impurity G); the area of any peak, apart from the principal peak and any peaks corresponding to impurities A, B and G, is not greater than the area of the peak corresponding to fenofibrate in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the peak corresponding to fenofibrate in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.1 times that of the peak due to fenofibrate in the chromatogram obtained with reference solution (b).

Halides expressed as chlorides (2.4.4). To 5 ml of solution S add 10 ml of *distilled water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *fenofibrate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *fenofibrate CRS*, 10.0 mg of *fenofibrate impurity A CRS*, 10.0 mg of *fenofibrate impurity B CRS* and 20.0 mg of *fenofibrate impurity G CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of *water R* acidified to pH 2.5 with *phosphoric acid R* and 70 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 286 nm.

Inject 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the peaks in the chromatogram is at least 50 per cent of the full scale of the recorder. Inject 5 µl of reference solution (a) six times. The assay is not valid unless the relative standard deviation of the peak area for fenofibrate is at most 1.0 per cent. Inject 5 µl of the test solution and 5 µl of reference solution (a).

STORAGE

Store protected from light.

IMPURITIES

A. R-H: (4-chlorophenyl)(4-hydroxyphenyl)methanone,

B. 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoic acid (fenofibric acid),

C. (3*RS*)-3-[4-(4-chlorobenzoyl)phenoxy]butan-2-one,

D. methyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate,

E. ethyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate,

F. (4-chlorophenyl)[4-(1-methylethoxy)phenyl]methanone,

- G. 1-methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate.

01/2005:0901

FENOTEROL HYDROBROMIDE

Fenoteroli hydrobromidum

C₁₇H₂₂BrNO₄M_r 384.3

DEFINITION

(1*RS*)-1-(3,5-dihydroxyphenyl)-2-[[1*RS*)-2-(4-hydroxyphenyl)-1-methylethyl]amino]ethanol hydrobromide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: soluble in water and in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 50.0 mg in *dilute hydrochloric acid R1* and dilute to 50.0 ml with the same acid. Dilute 5.0 ml to 50.0 ml with *dilute hydrochloric acid R1*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 275 nm and a shoulder at about 280 nm. The specific absorbance at the maximum is 80 to 86.

- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: Ph. Eur. reference spectrum of fenoterol hydrobromide.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *fenoterol hydrobromide CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: concentrated ammonia R, water R, aldehyde-free methanol R (1.5:10:90 V/V/V).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 10 g/l solution of *potassium permanganate R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dissolve about 10 mg in a 20 g/l solution of *disodium tetraborate R* and dilute to 50 ml with the same solution. Add 1 ml of a 10 g/l solution of *aminopyrazolone R*, 10 ml of a 2 g/l solution of *potassium ferricyanide R* and 10 ml of *methylene chloride R*. Shake and allow to separate. A reddish-brown colour develops in the lower layer.

- E. It gives reaction (a) of bromides (2.3.1).

TESTS

Solution S. Dissolve 2.00 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3): 4.2 to 5.2 for solution S.

Phenone: maximum 0.2 per cent. The absorbance (2.2.25) of solution S at 330 nm has a maximum of 0.42.

Diastereoisomers. Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 25.0 mg of *fenoterol hydrobromide CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R (5 µm to 10 µm).

Mobile phase: to a mixture of 1 volume of a 9 g/l solution of *potassium dihydrogen phosphate R* and 69 volumes of a 24 g/l solution of *disodium hydrogen phosphate R*, adjusted to pH 8.5 using *phosphoric acid R*, add 30 volumes of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl loop injector.

Sensitivity: the height of the peak due to the diastereoisomers eluting immediately after the principal peak is not less than 10 per cent of the full scale of the recorder.

System suitability: reference solution:

- the height of the trough separating the peak due to the diastereoisomers from the principal peak is less than 4 per cent of the full scale of the recorder,
- the retention time of the principal peak is less than 20 min.

Limits:

Calculate the content of diastereoisomers by determining the height of a perpendicular dropped from the apex of the peak to a line drawn from the trough between the 2 peaks to the baseline, and taking into account the declared content of diastereoisomers in *fenoterol hydrobromide CRS* (4.0 per cent).

Iron (2.4.9): maximum 5 ppm.

Dissolve the residue from the test for sulphated ash in 2.5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. The solution complies with the limit test for iron.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.600 g in 50 ml of *water R* and add 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *ferric ammonium sulphate solution R2*. Shake and titrate with 0.1 M *ammonium thiocyanate* until an orange colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *silver nitrate* is equivalent to 38.43 mg of $C_{17}H_{22}BrNO_4$.

STORAGE

Protected from light.

IMPURITIES

A. (1*RS*)-1-(3,5-dihydroxyphenyl)-2-[(1*RS*)-2-(4-hydroxyphenyl)-1-methylethyl]amino]ethanol,

B. 1-(3,5-dihydroxyphenyl)-2-[(1*RS*)-2-(4-hydroxyphenyl)-1-methylethyl]amino]ethanone (phenone).

01/2005:1210

FENTANYL

Fentanylum

$C_{22}H_{28}N_2O$

M_r 336.5

DEFINITION

Fentanyl contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]propanamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in alcohol and in methanol. It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of fentanyl*. If the spectrum obtained in the solid state shows differences, dissolve the substance to be examined in the minimum volume of *ethanol R*, evaporate to dryness at room temperature under an air-stream and record the spectrum again using the residue.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to prepare the *in situ* degradation compound (fentanyl impurity D), dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Neutralise with 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 μ m),
- as mobile phase at a flow rate of 1.5 ml/min the following mixtures:

Mobile phase A. A 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*,
Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 40	10 → 60	linear gradient
15 - 20	40	60	isocratic elution
20 - 25	90	10	switch to initial eluent composition
20 = 0	90	10	restart gradient

- as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 μ l of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 μ l of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: fentanyl about 10 min and fentanyl impurity D about 12 min. The test is not valid unless the resolution between the peaks corresponding to fentanyl and fentanyl impurity D is at least 8.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 μ l of *methanol R* as a blank, 10 μ l of the test solution and 10 μ l of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank run and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 50 °C.

ASSAY

01/2005:1103

Dissolve 0.200 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 33.65 mg of $C_{22}H_{28}N_2O$.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E, F, G.

A. *N*-phenyl-*N*-[*cis,trans*-1-oxido-1-(2-phenylethyl)piperidin-4-yl]propanamide,

B. R = CO-C₂H₅, R' = H: *N*-phenyl-*N*-(piperidin-4-yl)propanamide,

C. R = CO-CH₃, R' = CH₂-CH₂-C₆H₅: *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]acetamide,

D. R = H, R' = CH₂-CH₂-C₆H₅: *N*-phenyl-1-(2-phenylethyl)piperidin-4-amine,

E. R = CHO: benzaldehyde,

F. R = NH₂: aniline (phenylamine),

G. R = NH-CO-C₂H₅: *N*-phenylpropanamide.

FENTANYL CITRATE

Fentanyli citras

$C_{28}H_{36}N_2O_8$

M_r 528.6

DEFINITION

Fentanyl citrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]propanamide dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, soluble in water, freely soluble in methanol, sparingly soluble in alcohol.

It melts at about 152 °C with decomposition.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of fentanyl citrate*.

TESTS

Appearance of solution. Dissolve 0.2 g of the substance to be examined in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to prepare the *in situ* degradation compound (impurity D), dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Neutralise with 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min a gradient programme using the following conditions:

Mobile phase A. A 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 40	10 → 60	linear gradient
15 - 20	40	60	isocratic elution
20 - 25	90	10	switch to initial eluent composition
25 = 0	90	10	restart gradient

— as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: fentanyl about 10 min; impurity D about 12 min. The test is not valid unless the resolution between the peaks corresponding to fentanyl and impurity D is at least 8.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank run and any peak with a retention time relative to the principal peak of 0.05 or less and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 52.86 mg of C₂₈H₃₆N₂O₈.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E.

A. *N*-phenyl-*N*-[*cis,trans*-1-oxido-1-(2-phenylethyl)piperidin-4-yl]propanamide,

B. R = CO-C₂H₅, R' = H: *N*-phenyl-*N*-(piperidin-4-yl)propanamide,

C. R = CO-CH₃, R' = CH₂-CH₂-C₆H₅: *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]acetamide,

D. R = H, R' = CH₂-CH₂-C₆H₅: *N*-phenyl-1-(2-phenylethyl)piperidin-4-amine,

E. benzaldehyde.

01/2005:1211

FENTICONAZOLE NITRATE

Fenticonazoli nitras

C₂₄H₂₁Cl₂N₃O₄S

M_r 518.4

DEFINITION

Fenticonazole nitrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[(2*RS*)-2-(2,4-dichlorophenyl)-2-[[4-(phenylsulphonyl)benzyl]oxy]ethyl]-1*H*-imidazole nitrate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methanol and in dimethylformamide, sparingly soluble in ethanol.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Melting point (2.2.14): 134 °C to 137 °C.

B. Dissolve 20.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *ethanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 252 nm, a shoulder at about 270 nm and an absorption minimum at 236 nm. The specific absorption at the maximum is 260 to 280.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fenticonazole nitrate CRS*.

D. It gives the reaction of nitrates (2.3.1).

TESTS

Optical rotation (2.2.7). Dissolve 0.10 g in *methanol R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (d). To 5 ml of the test solution add 5.0 mg of *fenticonazole impurity D CRS*, dissolve in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μm to 10 μm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 70 volumes of *acetonitrile R* and 30 volumes of a phosphate buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate R* in 900 ml of *water R*, adjusting to pH 3.0 with *phosphoric acid R* and diluting to 1000 ml with *water R*,
- as detector a spectrophotometer set at 229 nm.

Inject 10 μl of reference solution (b). Adjust the sensitivity of the system so that the height of the peak due to fenticonazole is at least 10 per cent of the full scale of the recorder.

Inject separately 10 μl of reference solution (c) and 10 μl of reference solution (d). The test is not valid unless in the chromatogram obtained with reference solution (d), the resolution between the peak due to fenticonazole impurity D and fenticonazole is at least 2.0. The test is not valid unless in the chromatogram obtained with reference solution (c) the signal-to-noise ratio is at least five.

Inject separately 10 μl of the test solution and 10 μl of reference solution (a). Record the chromatogram obtained with the test solution for 5.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak and the nitric ion peak (which corresponds to the dead volume of the column), is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Toluene. Not more than 100 ppm, determined by head-space gas chromatography (2.2.28), using the standard additions method.

Test solution. Disperse 0.2 g of the substance to be examined in a 10 ml vial with 5 ml of *water R*.

Reference solution. Mix 4 mg of *toluene R* with *water R* and dilute to 1000 ml. Place 5 ml of this solution in a 10 ml vial.

The chromatographic procedure may be carried out using:

- a column 25 m long and 0.32 mm in internal diameter coated with *poly(cyanopropyl)(7)phenyl(7)methyl(86)siloxane R* (film thickness 1.2 μm),
 - *helium for chromatography R* as the carrier gas, split ratio 1:25, column head pressure 40 kPa,
 - a flame-ionisation detector,
- maintaining the temperature of the column at 80 $^\circ\text{C}$, that of the injection port at 180 $^\circ\text{C}$ and that of the detector at 220 $^\circ\text{C}$. Maintain each solution at 90 $^\circ\text{C}$ for 1 h, and transfer onto the column 1 ml of the vapour phase.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 $^\circ\text{C}$.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.450 g in 50 ml of a mixture of equal volumes of *anhydrous acetic acid R* and *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 51.84 mg of $\text{C}_{24}\text{H}_{21}\text{Cl}_2\text{N}_3\text{O}_4\text{S}$.

STORAGE

Store protected from light.

IMPURITIES

A. (RS)-1-(2,4-dichlorophenyl)-2-(1H-imidazol-1-yl)ethanol,

B. X = SO: 1-[(2RS)-2-(2,4-dichlorophenyl)-2-[[4-(phenylsulphonyl)benzyl]oxy]ethyl]-1H-imidazole,

C. X = SO₂: 1-[(2RS)-2-(2,4-dichlorophenyl)-2-[[4-(phenylsulphonyl)benzyl]oxy]ethyl]-1H-imidazole,

D. (RS)-1-[2-(2,4-dichlorophenyl)-2-hydroxyethyl]-3-[4-(phenylsulphonyl)benzyl]imidazolium nitrate,

- E. (RS)-1-[2-(2,4-dichlorophenyl)-2-[4-(phenylsulphanyl)benzyloxy]ethyl]-3-[4-(phenylsulphanyl)benzyl]imidazolium nitrate.

01/2005:1323

FENUGREEK

Trigonellae foenugraeci semen

DEFINITION

Fenugreek consists of the dried, ripe seeds of *Trigonella foenum-graecum* L.

CHARACTERS

Fenugreek has a strong characteristic aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The seed is hard, flattened, brown to reddish-brown and more or less rhomboidal with rounded edges. It is 3 mm to 5 mm long, 2 mm to 3 mm wide and 1.5 mm to 2 mm thick. The widest surfaces are marked by a groove that divides the seed into two unequal parts. The smaller part contains the radicle; the larger part contains the cotyledons.
- B. Reduce to a powder (355). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the testa in sectional view with thick cuticle covering lageniform epidermal cells, with an underlying hypodermis of large cells, narrower at the upper end and constricted in the middle, with bar-like thickenings of the radial walls; yellowish-brown fragments of the epidermis in surface view, composed of small, polygonal cells with thickened and pitted walls, frequently associated with the hypodermal cells, circular in outline with thickened and closely beaded walls; fragments of the hypodermis viewed from below, composed of polygonal cells whose bar-like thickenings extend to the upper and lower walls; parenchyma of the testa with elongated, rectangular cells with slightly thickened and beaded walls; fragments of endosperm with irregularly thickened, sometimes elongated cells, containing mucilage.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.
Test solution. Place 1.0 g of the powdered drug (710) in a 25 ml conical flask and add 5.0 ml of *methanol R*. Heat in a water-bath at 65 °C for 5 min. Cool and filter.
Reference solution. Dissolve 3.0 mg of *trigonelline hydrochloride R* in 1.0 ml of *methanol R*.
 Apply to the plate as bands 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 30 volumes of *water R* and 70 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The

chromatogram obtained with the test solution shows in its lower half a quenching zone similar in position and fluorescence to the zone in the chromatogram obtained with the reference solution. Spray with *potassium iodobismuthate solution R2*. The chromatogram obtained with the test solution shows an intense orange-red zone similar in position and colour to the zone in the chromatogram obtained with the reference solution. It also shows in its upper half a broad, light brownish-yellow zone (triglycerides).

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Swelling index (2.8.4). Not less than 6, determined on the powdered drug (710).

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 5.0 per cent.

STORAGE

Store protected from light.

01/2005:1515

FERRIC CHLORIDE HEXAHYDRATE

Ferri chloridum hexahydricum

FeCl₃·6H₂OM_r 270.3

DEFINITION

Ferric chloride hexahydrate contains not less than 98.0 per cent and not more than 102.0 per cent of FeCl₃·6H₂O.

CHARACTERS

Crystalline mass or orange-yellow to brownish-yellow crystals, very hygroscopic, very soluble in water and in alcohol, freely soluble in glycerol.

IDENTIFICATION

- A. It gives reaction (a) of chlorides (2.3.1).
 B. It gives reaction (c) of iron (2.3.1).

TESTS

Solution S. Dissolve 10 g in *distilled water R* and dilute to 100 ml with the same solvent.

Acidity. In a suitable polyethylene container, dissolve 3.0 g of *potassium fluoride R* in 15 ml of *water R*. Titrate with 0.1 M *sodium hydroxide* using 0.1 ml of *phenolphthalein solution R* as indicator until a pink colour is obtained. Add 10 ml of solution S and allow to stand for 3 h. Filter and use 12.5 ml of the filtrate. Not more than 0.30 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Free chlorine. Heat 5 ml of solution S. The vapour does not turn *starch iodide paper R* blue.

Sulphates (2.4.13). Heat 15 ml of solution S on a water-bath and add 5 ml of *strong sodium hydroxide solution R*. Allow to cool and filter. Neutralise the filtrate to *blue litmus paper R* using *hydrochloric acid R1* and evaporate to 15 ml. The solution complies with the limit test for sulphates (100 ppm).

Ferrous ions. To 10 ml of solution S, add 1 ml of *water R*, 0.05 ml of *potassium ferricyanide solution R* followed by 4 ml of *phosphoric acid R*. After 10 min, any blue colour

in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of *water R* and 1 ml of a freshly prepared 0.250 g/l solution of *ferrous sulphate R* (50 ppm Fe).

Heavy metals (2.4.8). Dissolve 1.0 g in 10 ml of *hydrochloric acid R1*. Add 2 ml of *strong hydrogen peroxide solution R*, then evaporate to 5 ml. Allow to cool and dilute to 20 ml with *hydrochloric acid R1* and transfer the solution to a separating funnel. Shake three times, for 3 min each time, with 20 ml of *methyl isobutyl ketone R1*. Separate the lower phase, reduce to half its volume by evaporation and dilute to 25 ml with *water R*. Neutralise 10 ml of the solution with *dilute ammonia R1* to *red litmus paper R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (50 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

In a conical flask with a ground-glass stopper, dissolve 0.200 g in 20 ml of *water R*. Add 10 ml of *dilute hydrochloric acid R* and 2 g of *potassium iodide R*. Allow the stoppered flask to stand for 1 h protected from light. Titrate with 0.1 M *sodium thiosulphate*, using 5 ml of *starch solution R* as indicator, added towards the end of the titration.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 27.03 mg of $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$.

STORAGE

Store in an airtight container, protected from light.

01/2005:0902

FERROUS FUMARATE

Ferrosi fumaras

$\text{C}_4\text{H}_2\text{FeO}_4$

M_r 169.9

DEFINITION

Ferrous fumarate contains not less than 93.0 per cent and not more than the equivalent of 101.0 per cent of iron(II) (*E*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A fine, reddish-orange or reddish-brown powder, slightly soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. To 1.0 g add 25 ml of a mixture of equal volumes of *hydrochloric acid R* and *water R* and heat on a water-bath for 15 min. Cool and filter. Use the filtrate for identification test C. Wash the residue with 50 ml of a mixture of 1 volume of *dilute hydrochloric acid R* and 9 volumes of *water R* and discard the washings. Dry the residue at 100–105 °C. Dissolve 20 mg of the residue in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *fumaric acid CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 10 cm using a mixture of 12 volumes of *anhydrous formic acid R*, 16 volumes

of *methylene chloride R*, 32 volumes of *butanol R* and 44 volumes of *heptane R*. Dry the plate at 105 °C for 15 min and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- B. Mix 0.5 g with 1 g of *resorcinol R*. To 0.5 g of the mixture in a crucible add 0.15 ml of *sulphuric acid R* and heat gently. A dark red semi-solid mass is formed. Add the mass, with care, to 100 ml of *water R*. An orange-yellow colour develops and the solution shows no fluorescence.
- C. The filtrate obtained for the test solution in identification test A gives reaction (a) of iron (2.3.1).

TESTS

Solution S. Dissolve 2.0 g of the substance to be examined in a mixture of 10 ml of *lead-free hydrochloric acid R* and 80 ml of *water R*, heating slightly if necessary. Allow to cool, filter if necessary and dilute to 100 ml with *water R*.

Sulphates (2.4.13). Heat 0.15 g with 8 ml of *dilute hydrochloric acid R* and 20 ml of *distilled water R*. Cool in iced water, filter and dilute to 30 ml with *distilled water R*. 15 ml of this solution complies with the limit test for sulphates (0.2 per cent).

Arsenic (2.4.2). Mix 1.0 g with 15 ml of *water R* and 15 ml of *sulphuric acid R*. Warm to precipitate the fumaric acid completely. Cool and add 30 ml of *water R*. Filter. Wash the precipitate with *water R*. Dilute the combined filtrate and washings to 125 ml with *water R*. 25 ml of the solution complies with limit test A for arsenic (5 ppm).

Ferric ion. Not more than 2.0 per cent of ferric ion.

In a flask with a ground-glass stopper, dissolve 3.0 g in a mixture of 10 ml of *hydrochloric acid R* and 100 ml of *water R* by heating rapidly to boiling. Boil for 15 s. Cool rapidly, add 3 g of *potassium iodide R*, stopper the flask and allow to stand protected from light for 15 min. Add 2 ml of *starch solution R* as indicator. Titrate the liberated iodine with 0.1 M *sodium thiosulphate*. Carry out a blank test. The difference between the volumes used in the two titrations corresponds to the amount of iodine liberated by ferric ion.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 5.585 mg of ferric ion.

Cadmium. Not more than 10 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a 10 per cent V/V solution of *lead-free hydrochloric acid R*.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Chromium. Not more than 200 ppm of Cr, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the solutions using *chromium standard solution (0.1 per cent Cr) R* and diluting with a 10 per cent V/V solution of *lead-free hydrochloric acid R*.

Measure the absorbance at 357.9 nm using a chromium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Lead. Not more than 20 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the solutions using *lead standard solution (10 ppm Pb) R* and diluting with a 10 per cent V/V solution of *lead-free hydrochloric acid R*.

Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as the source of radiation and an air-acetylene flame.

Mercury. Not more than 1 ppm of Hg, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the solutions using *mercury standard solution (10 ppm Hg) R* and diluting with a 25 per cent V/V solution of *lead-free hydrochloric acid R*.

Following the recommendations of the manufacturer, introduce 5 ml of solution S or 5 ml of the reference solutions into the reaction vessel of the cold-vapour mercury assay accessory, add 10 ml of *water R* and 1 ml of *stannous chloride solution R1*.

Measure the absorbance at 253.7 nm using a mercury hollow-cathode lamp as the source of radiation.

Nickel. Not more than 200 ppm of Ni, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S.

Reference solutions. Prepare the solutions using *nickel standard solution (10 ppm Ni) R* and diluting with a 10 per cent V/V solution of *lead-free hydrochloric acid R*.

Measure the absorbance at 232 nm using a nickel hollow-cathode lamp as source of radiation and an air-acetylene flame.

Zinc. Not more than 500 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S diluted ten times.

Reference solutions. Prepare the solutions using *zinc standard solution (10 ppm Zn) R* and diluting with a 1 per cent V/V solution of *lead-free hydrochloric acid R*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve with slight heating 0.150 g in 7.5 ml of *dilute sulphuric acid R*. Cool and add 25 ml of *water R*. Add 0.1 ml of *ferroin R*. Titrate immediately with 0.1 M *cerium sulphate* until the colour changes from orange to light bluish-green.

1 ml of 0.1 M *cerium sulphate* is equivalent to 16.99 mg of C₁₂H₂₂FeO₁₄.

STORAGE

Store in an airtight container, protected from light.

DEFINITION

Ferrous gluconate is iron(II) di(D-gluconate). It contains not less than 11.8 per cent and not more than 12.5 per cent of iron(II), calculated with reference to the dried substance.

CHARACTERS

A greenish-yellow to grey powder or granules, freely but slowly soluble in water giving a greenish-brown solution, more readily soluble in hot water, practically insoluble in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 20 mg of the substance to be examined in 2 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Reference solution. Dissolve 20 mg of *ferrous gluconate CRS* in 2 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *ethyl acetate R*, 10 volumes of *concentrated ammonia R*, 30 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate at 100 °C to 105 °C for 20 min, allow to cool and spray with a 50 g/l solution of *potassium dichromate R* in a 40 per cent m/m solution of *sulphuric acid R*. After 5 min, the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. 1 ml of solution S (see Tests) gives reaction (a) of iron (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and heated to about 60 °C, cool and dilute to 50 ml with *carbon dioxide-free water R* prepared from *distilled water R*.

Appearance of solution. Dilute 2 ml of solution S to 10 ml with *water R*. Examined against the light, the solution is clear (2.2.1).

pH (2.2.3). The pH of solution S, measured 3 h to 4 h after preparation, is 4.0 to 5.5.

Sucrose and reducing sugars. Dissolve 0.5 g in 10 ml of warm *water R* and add 1 ml of *dilute ammonia R1*. Pass *hydrogen sulphide R* through the solution and allow to stand for 30 min. Filter and wash the precipitate with two quantities, each of 5 ml, of *water R*. Acidify the combined filtrate and washings to *blue litmus paper R* with *dilute hydrochloric acid R* and add 2 ml in excess. Boil until the vapour no longer darkens *lead acetate paper R* and continue boiling, if necessary, until the volume is reduced to about 10 ml. Cool, add 15 ml of *sodium carbonate solution R*, allow to stand for 5 min and filter. Dilute the filtrate to 100 ml with *water R*. To 5 ml of this solution add 2 ml of *cupri-tartaric solution R* and boil for 1 min. Allow to stand for 1 min. No red precipitate is formed.

Chlorides (2.4.4). 0.8 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (0.06 per cent).

Oxalates. Dissolve 5.0 g in a mixture of 10 ml of *dilute sulphuric acid R* and 40 ml of *water R*. Shake the solution with 50 ml of *ether R* for 5 min. Separate the aqueous layer and shake it with 20 ml of *ether R* for 5 min. Combine the ether layers, evaporate to dryness and dissolve the residue in 15 ml of *water R*. Filter, boil the filtrate until the volume

01/2005:0493

FERROUS GLUCONATE

Ferrosi gluconas

C₁₂H₂₂FeO₁₄·xH₂O

M_r 446.1 (anhydrous substance)

01/2005:0083

is reduced to 5 ml and add 1 ml of *dilute acetic acid R* and 1.5 ml of *calcium chloride solution R*. Allow to stand for 30 min. No precipitate is formed.

Sulphates (2.4.13). To 3.0 ml of solution S add 3 ml of *acetic acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (500 ppm). Examine the solutions against the light.

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Barium. Dilute 10 ml of solution S to 50 ml with *distilled water R* and add 5 ml of *dilute sulphuric acid R*. Allow to stand for 5 min. Any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 45 ml of *distilled water R*.

Ferric ion. In a ground-glass-stoppered flask, dissolve 5.00 g in a mixture of 10 ml of *hydrochloric acid R* and 100 ml of *carbon dioxide-free water R*. Add 3 g of *potassium iodide R*, close the flask and allow to stand protected from light for 5 min. Titrate with 0.1 M *sodium thiosulphate*, using 0.5 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration. Not more than 9.0 ml of 0.1 M *sodium thiosulphate* is used in the test (1.0 per cent).

Heavy metals (2.4.8). Thoroughly mix 2.5 g with 0.5 g of *magnesium oxide R1* in a silica crucible. Ignite to dull redness until a homogeneous mass is obtained. Heat at 800 °C for about 1 h, allow to cool and take up the residue in 20 ml of hot *hydrochloric acid R*. Allow to cool. Transfer the liquid to a separating funnel and shake for 3 min with three quantities, each of 20 ml, of methyl isobutyl ketone saturated with hydrochloric acid (prepared by shaking 100 ml of freshly distilled *methyl isobutyl ketone R* with 1 ml of *hydrochloric acid R*). Allow to stand, separate the aqueous layer, reduce to half its volume by boiling, allow to cool and dilute to 25 ml with *water R*. Neutralise 10 ml of this solution to *red litmus paper R* using *dilute ammonia R1* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 5.0 per cent to 10.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C for 5 h.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate count.

ASSAY

Dissolve 0.5 g of *sodium hydrogen carbonate R* in a mixture of 30 ml of *dilute sulphuric acid R* and 70 ml of *water R*. When the effervescence stops, dissolve in the solution 1.00 g of the substance to be examined with gentle shaking. Using 0.1 ml of *ferroin R* as indicator, titrate with 0.1 M *ammonium and cerium nitrate* until the red colour disappears.

1 ml of 0.1 M *ammonium and cerium nitrate* is equivalent to 5.585 mg of iron(II).

STORAGE

Store protected from light.

FERROUS SULPHATE HEPTAHYDRATE

Ferrosi sulfas heptahydricus

FeSO₄·7H₂O

M_r 278.0

DEFINITION

Content: 98.0 per cent to 105.0 per cent.

CHARACTERS

Appearance: light green, crystalline powder or bluish-green crystals, efflorescent in air.

Solubility: freely soluble in water, very soluble in boiling water, practically insoluble in alcohol.

Ferrous sulphate is oxidised in moist air, becoming brown.

IDENTIFICATION

- A. It gives the reaction of sulphates (2.3.1).
- B. It gives reaction (a) of iron (2.3.1).
- C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R*, add 0.5 ml of *dilute sulphuric acid R* and dilute to 50 ml with *water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1).

pH (2.2.3): 3.0 to 4.0.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Chlorides (2.4.4): maximum 300 ppm.

Dilute 3.3 ml of solution S to 10 ml with *water R* and add 5 ml of *dilute nitric acid R*. The solution complies with the limit test for chlorides. Prepare the standard using a mixture of 10 ml of *chloride standard solution (5 ppm Cl) R* and 5 ml of *dilute nitric acid R*. Use 0.15 ml of *silver nitrate solution R2* in this test.

Ferric ions: maximum 0.5 per cent.

In a ground-glass-stoppered flask, dissolve 5.00 g in a mixture of 10 ml of *hydrochloric acid R* and 100 ml of *carbon dioxide-free water R*. Add 3 g of *potassium iodide R*, close the flask and allow to stand in the dark for 5 min. Titrate the liberated iodine with 0.1 M *sodium thiosulphate*, using 0.5 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank test in the same conditions. Not more than 4.5 ml of 0.1 M *sodium thiosulphate* is used, taking into account the blank titration.

Manganese: maximum 0.1 per cent.

Dissolve 1.0 g in 40 ml of *water R*, add 10 ml of *nitric acid R* and boil until red fumes are evolved. Add 0.5 g of *ammonium persulphate R* and boil for 10 min. Discharge any pink colour by adding dropwise a 50 g/l solution of *sodium sulphite R* and boil until any odour of sulphur dioxide is eliminated. Add 10 ml of *water R*, 5 ml of *phosphoric acid R* and 0.5 g of *sodium periodate R*, boil for 1 min and allow to cool. The solution is not more intensely coloured than a standard prepared at the same time in the same manner using 1.0 ml of 0.02 M *potassium permanganate* and adding the same volumes of the same reagents.

Zinc: maximum 500 ppm.

To 5 ml of solution A obtained in the test for heavy metals add 1 ml of *potassium ferrocyanide solution R* and dilute

to 13 ml with *water R*. After 5 min, any turbidity produced is not more intense than that of a standard prepared at the same time by mixing 10 ml of *zinc standard solution (10 ppm Zn) R*, 2 ml of *hydrochloric acid R1* and 1 ml of *potassium ferrocyanide solution R*.

Heavy metals (2.4.8): maximum 50 ppm.

Dissolve 1.0 g in 10 ml of *hydrochloric acid R1*, add 2 ml of *strong hydrogen peroxide solution R* and boil until the volume is reduced to 5 ml. Allow to cool, dilute to 20 ml with *hydrochloric acid R1*, transfer the solution to a separating funnel and shake for 3 min with 3 quantities, each of 20 ml, of methyl isobutyl ketone saturated with hydrochloric acid (prepared by shaking 100 ml of freshly distilled *methyl isobutyl ketone R* with 1 ml of *hydrochloric acid R1*). Allow to stand, separate the aqueous layer and reduce to half its volume by boiling, allow to cool and dilute to 25 ml with *water R* (solution A). Neutralise 10 ml of solution A to *litmus paper R* using *dilute ammonia R1* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 2.5 g of *sodium hydrogen carbonate R* in a mixture of 150 ml of *water R* and 10 ml of *sulphuric acid R*. When the effervescence ceases add to the solution 0.500 g of the substance to be examined and dissolve with gentle shaking. Add 0.1 ml of *ferroin R* and titrate with 0.1 M *ammonium and cerium nitrate* until the red colour disappears.

1 ml of 0.1 M *ammonium and cerium nitrate* is equivalent to 27.80 mg of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

STORAGE

In an airtight container.

01/2005:1516

FEVERFEW

Tanacetum parthenii herba

DEFINITION

Feverfew consists of the dried, whole or fragmented aerial parts of *Tanacetum parthenium* (L.) Schultz Bip. It contains not less than 0.20 per cent of parthenolide ($\text{C}_{15}\text{H}_{20}\text{O}_3$; M_r 248.3), calculated with reference to the dried drug.

CHARACTERS

Fewerfew has a camphoraceous odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The leafy, more or less branched stem has a diameter of up to 5 mm; it is almost quadrangular, channelled longitudinally and slightly pubescent. The leaves are ovate, 2 cm to 5 cm long, sometimes up to 10 cm, yellowish-green, petiolate and alternate. They are pinnate or bipinnate, deeply divided into five to nine segments, each with a coarsely crenate margin and an obtuse apex. Both surfaces are somewhat pubescent and the midrib is prominent on the lower surface. When present, the flowering heads are 12 mm to 22 mm in diameter with long pedicels; they are clustered into broad corymbs consisting of five to thirty flower-heads. The hemispherical involucre is 6 mm to 8 mm wide and consists of many overlapping bracts, which are rather narrow, are obtuse and scarious and have membranous

margins. The central flowers are yellow, hermaphrodite, tube-shaped with five teeth and have five stamens inserted in the corolla; the filaments of the stamens are separate from each other but the anthers are fused into a tube through which passes the style, bearing two stigmatic branches. The peripheral flowers are female and have a white three-toothed ligule, 2 mm to 7 mm long. The fruit is an achene, 1.2 mm to 1.5 mm long, brown when ripe, with five to ten white longitudinal ribs. It is glandular and bears a short, crenate, membranous crown.

B. Reduce to a powder (355). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous large, multicellular, uniseriate covering trichomes consisting of a rhomboidal basal cell, three to five smaller, thick-walled rectangular cells and a very long, flat, slender terminal cell, often curved at a right angle to the axis of the basal cell; glandular trichomes with a short, biseriate, two to four celled stalk and a biseriate head of four cells around which the cuticle forms a bladder-like covering; epidermal cells with a very sinuous anticlinal walls, a striated cuticle and anomocytic stomata; numerous spirally and annularly thickened vessels; stratified parenchyma and collenchyma. Fragments of disc florets containing pale yellow amorphous masses and small rosette crystals of calcium oxalate may be present; spherical pollen grains about 25 µm in diameter, with three pores and a spiny exine may be present.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 1 g of the powdered drug (355) add 20 ml of *methanol R*. Heat in a water-bath at 60 °C for 15 min. Allow to cool and filter. Evaporate to dryness under reduced pressure and dissolve the residue in 2 ml of *methanol R*.

Reference solution. Dissolve 5 mg of *parthenolide R* in *methanol R* and dilute to 5 ml with the same solvent.

Apply to the plates as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 15 volumes of *acetone R* and 85 volumes of *toluene R*. Allow the plate to dry in air. Spray with a 5 g/l solution of *vanillin R* in a mixture of 20 volumes of *ethanol R* and 80 volumes of *sulphuric acid R*. After 5 min examine in daylight. The chromatogram obtained with the test solution shows in its central part a blue principal zone that is similar in position, colour and size to the principal zone in the chromatogram obtained with the reference solution, and somewhat below the principal zone it may show a second blue zone. It also shows, one or two blue zones in its lower third. Other violet zones may be present.

TESTS

Foreign matter (2.8.2). Not more than 10.0 per cent of stem having a diameter exceeding 5 mm, and not more than 2.0 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 12.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Completely reduce about 50 g to a powder (355). After homogenisation, introduce 1.00 g of the powdered drug into a flask and add 40 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Allow to cool

and filter. Rinse the filter with 15 ml of *methanol R*. Take up the residue with 40 ml of *methanol R*. Repeat the operation. Collect the filtrates and rinsings and evaporate to dryness under reduced pressure. Take up the residue with *methanol R* and dilute to 20.0 ml with the same solvent. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase. Filter (0.45 µm).

Reference solution. Dissolve 5.0 mg of *parthenolide R* in *methanol R* and dilute to 10.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 220 nm,

Inject 20 µl of each solution. The retention time of parthenolide is about 11.5 min.

Calculate the percentage content of parthenolide from the expression:

$$\frac{A_1 \times m_2 \times 40}{A_2 \times m_1}$$

A_1 = area corresponding to the principal compound in the chromatogram obtained with the test solution,

A_2 = area corresponding to the principal compound in the chromatogram obtained with the reference solution,

m_1 = mass of the drug used in the test solution, in grams,

m_2 = mass of parthenolide in the reference solution, in grams.

STORAGE

Store protected from light.

corrected

FIBRIN SEALANT KIT

Fibrini glutinum

DEFINITION

Fibrin sealant kit is essentially composed of 2 components, namely fibrinogen concentrate (component 1), a protein fraction containing human fibrinogen and a preparation containing human thrombin (component 2). A fibrin clot is rapidly formed when the 2 thawed or reconstituted components are mixed. Other ingredients (for example, human coagulation factor XIII, a fibrinolysis inhibitor or calcium ions) and stabilisers (for example, *Human albumin solution (0255)*) may be added. No antimicrobial preservative is added.

Human constituents are obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*. No antibiotic is added to the plasma used.

When thawed or reconstituted as stated on the label, component 1 contains not less than 40 g/l of clottable protein; the thrombin activity of component 2 varies over a wide range (approximately 4-1000 IU/ml).

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

Constituents or mixtures of constituents are passed through a bacteria-retentive filter and distributed aseptically into sterile containers. Containers of freeze-dried constituents are closed under vacuum or filled with oxygen-free nitrogen or other suitable inert gas before being closed. In either case, they are closed so as to exclude micro-organisms.

If the human coagulation factor XIII content in component 1 is greater than 10 units/ml, the assay of factor XIII is carried out.

CHARACTERS

Freeze-dried constituents are hygroscopic, white or pale yellow powders or friable solids. Frozen constituents are colourless or pale yellow, opaque solids. Liquid constituents are colourless or pale yellow.

For the freeze-dried or frozen constituents, reconstitute or thaw as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

Component 1 (fibrinogen concentrate)

IDENTIFICATION

- A. It complies with the limits of the assay of fibrinogen.
- B. It complies with the limits of the assay of factor XIII (where applicable).

TESTS

pH (2.2.3): 6.5 to 8.0.

Solubility. Freeze-dried concentrates dissolve within 20 min in the volume of solvent for reconstitution and at the temperature stated on the label, forming an almost colourless, clear or slightly turbid solution.

Stability of solution. No gel formation appears at room temperature during 120 min following thawing or reconstitution.

Water. Determined by a suitable method, such as the semi-microdetermination (2.5.12), loss on drying (2.2.32) or near infrared spectrophotometry (2.2.40), the water content is within the limits approved by the competent authority.

Sterility (2.6.1). It complies with the test for sterility.

ASSAY

Fibrinogen (clottable protein). The estimated content in milligrams of clottable protein is not less than 70 per cent and not more than 130 per cent of the content stated on the label.

Mix 0.2 ml of the reconstituted preparation with 2 ml of a suitable buffer solution (pH 6.6-7.4) containing sufficient *human thrombin R* (approximately 3 IU/ml) and calcium (0.05 mol/l). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 g, 20 min), wash thoroughly with a 9 g/l solution of *sodium chloride R* and determine the protein as nitrogen by sulphuric acid digestion (2.5.9). Calculate the protein content by multiplying the result by 6.0. If for a particular preparation this method cannot be applied, use another validated method for determination of fibrinogen.

Factor XIII. Where the label indicates that the human coagulation factor XIII activity is greater than 10 units/ml, the estimated activity is not less than 80 per cent and not more than 120 per cent of the activity stated on the label.

Make at least 3 suitable dilutions of thawed or reconstituted component 1 and of human normal plasma (reference preparation) using as diluent coagulation factor XIII deficient plasma or another suitable diluent. Add to each dilution suitable amounts of the following reagents:

- activator reagent, containing bovine or human thrombin, a suitable buffer, calcium chloride and a suitable inhibitor such as Gly-Pro-Arg-Pro-Ala-NH₂ which inhibits clotting of the sample but does not prevent coagulation factor XIII activation by thrombin,
- detection reagent, containing a suitable factor XIIIa-specific peptide substrate, such as Leu-Gly-Pro-Gly-Glu-Ser-Lys-Val-Ile-Gly-NH₂ and glycine ethyl ester as 2nd substrate in a suitable buffer solution,
- NADH reagent, containing glutamate dehydrogenase, α-ketoglutarate and NADH in a suitable buffer solution.

After mixing, the absorbance changes ($\Delta A/\text{min}$) are measured at a wavelength of 340 nm, after the linear phase of the reaction is reached.

1 unit of factor XIII is equal to the activity of 1 ml of human normal plasma.

Calculate the activity of the test preparation by the usual statistical methods (5.3, for example). The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

Component 2 (thrombin preparation)

IDENTIFICATION

It complies with the limits of the assay of thrombin.

TESTS

pH (2.2.3): 5.0 to 8.0.

Solubility. Freeze-dried preparations dissolve within 5 min in the volume of solvent for reconstitution stated on the label, forming a colourless, clear or slightly turbid solution.

Water. Determined by a suitable method, such as the semi-microdetermination (2.5.12), loss on drying (2.2.32) or near infrared spectrophotometry (2.2.40), the water content is within the limits approved by the competent authority.

Sterility (2.6.1). It complies with the test for sterility.

ASSAY

Thrombin. The estimated activity is not less than 80 per cent and not more than 125 per cent of the activity stated on the label.

If necessary, dilute the reconstituted preparation to be examined to approximately 2·20 IU of thrombin per millilitre using as diluent a suitable buffer pH 7.3–7.5, such as *imidazole buffer solution pH 7.3 R* containing 10 g/l of *human albumin R* or *bovine albumin R*. To a suitable volume of the dilution, add a suitable volume of fibrinogen solution (1 g/l of clottable protein) warmed to 37 °C and start measurement of the clotting time immediately. Repeat the procedure with each of at least 3 dilutions, in the range stated above, of a reference preparation of thrombin, calibrated in International Units. Calculate the activity of the test preparation by the usual statistical methods (5.3, for example). The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

STORAGE

Protected from light and, for freeze-dried components, in an airtight container.

LABELLING

The label states:

- the amount of fibrinogen (milligrams of clottable protein), thrombin (International Units) per container, and coagulation factor XIII, if this is greater than 10 units/ml,
- where applicable, the name and volume of solvent to be used to reconstitute the components.

01/2005:1615

FINASTERIDE

Finasteridum

C₂₃H₃₆N₂O₂

M_r 372.6

DEFINITION

N-(1,1-Dimethylethyl)-3-oxo-4-aza-5α-androst-1-ene-17β-carboxamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in ethanol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *finasteride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Specific optical rotation (2.2.7): + 12.0 to + 14.0 (dried substance).

Dissolve 0.250 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 50.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.100 g of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25.0 mg of *finasteride CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 50.0 mg of *finasteride* for *system suitability CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (c). Dilute 2.0 ml of test solution (b) to 100.0 ml in a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
 - **stationary phase:** *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a ratio of specific surface area (m^2g^{-1})/carbon-percentage less than 20,
 - **temperature:** 60 °C.
- Mobile phase:** *acetonitrile R*, *tetrahydrofuran R*, *water R* (10:10:80 V/V/V).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 15 μ l; inject test solution (b) and reference solutions (b) and (c).

Run time: twice the retention time of *finasteride*.

Relative retention with reference to *finasteride* (retention time = about 28 min): impurity A = about 0.94; impurity B = about 1.22; impurity C = about 1.36.

System suitability: reference solution (b):

- **peak-to-valley ratio:** minimum 2.5, where H_p = height above the baseline of the peak due to impurity A, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to *finasteride*.
- Limits:**
- **impurity A:** maximum 0.3 per cent, calculated from the area of the corresponding peak in the chromatogram obtained with reference solution (b) and taking into account the assigned value of impurity A in *finasteride* for *system suitability CRS*,
 - **impurity B:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent),
 - **impurity C:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent),
 - **any other impurity:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
 - **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent),
 - **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution (a) and reference solution (a).

Calculate the percentage content of $\text{C}_{23}\text{H}_{36}\text{N}_2\text{O}_2$.

STORAGE

Protected from light.

IMPURITIES

A. *N*-(1,1-dimethylethyl)-3-oxo-4-aza-5 α -androstane-17 β -carboxamide (dihydrofinasteride),

B. methyl 3-oxo-4-aza-5 α -androst-1-ene-17 β -carboxylate (Δ -1-aza ester),

C. *N*-(1,1-dimethylethyl)-3-oxo-4-azaandrosta-1,5-diene-17 β -carboxamide (Δ -1,5-aza amide).

01/2005:1912
corrected

FISH OIL, RICH IN OMEGA-3-ACIDS

Piscis oleum omega-3 acidis abundans

DEFINITION

Purified, winterised and deodorised fatty oil obtained from fish of the families *Engraulidae*, *Carangidae*, *Clupeidae*, *Osmeridae*, *Scombridae* and *Ammodytidae*. The omega-3 acids are defined as the following acids: *alpha*-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA), heneicosapentaenoic acid (C21:5 n-3), clupanodonic acid (C22:5 n-3) and cervonic (docosahexaenoic) acid (C22:6 n-3; DHA).

Content:

- EPA, expressed as triglycerides: minimum 13.0 per cent,
- DHA, expressed as triglycerides: minimum 9.0 per cent,
- total omega-3-acids, expressed as triglycerides: minimum 28.0 per cent.

Authorised antioxidants in concentrations not exceeding the levels specified by the competent authorities may be added.

CHARACTERS

Appearance: pale yellow liquid.

Solubility: practically insoluble in water, very soluble in acetone and in heptane, slightly soluble in ethanol.

IDENTIFICATION

Examine the chromatograms obtained in the assay for EPA and DHA.

Results: the peaks due to eicosapentaenoic acid methyl ester and to docosahexaenoic acid methyl ester in the chromatogram obtained with test solution (b) are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (a).

TESTS

Appearance. The substance to be examined is not more intensely coloured than a reference solution prepared as follows: to 3.0 ml of red primary solution add 25.0 ml of yellow primary solution and dilute to 50.0 ml with a 10 g/l solution of *hydrochloric acid R* (2.2.2, *Method II*).

Absorbance (2.2.25): maximum 0.70 at 233 nm.

Dilute 0.300 g of the substance to be examined to 50.0 ml with *trimethylpentane R*. Dilute 2.0 ml of this solution to 50.0 ml with *trimethylpentane R*.

Acid value (2.5.1): maximum 0.5, determined on 20.0 g in 50 ml of the prescribed mixture of solvents.

Anisidine value: maximum 30.0.

The anisidine value is defined as 100 times the absorbance measured in a 1 cm cell filled with a solution containing 1 g of the substance to be examined in 100 ml of a mixture of solvents and reagents according to the method described below.

Carry out the operations as rapidly as possible, avoiding exposure to actinic light.

Test solution (a). Dilute 0.500 g of the substance to be examined to 25.0 ml with *trimethylpentane R*.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and store protected from light.

Reference solution. To 5.0 ml of *trimethylpentane R* add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and store protected from light.

Measure the absorbance (2.2.25) of test solution (a) at 350 nm using *trimethylpentane R* as the compensation liquid. Measure the absorbance of test solution (b) at 350 nm exactly 10 min after its preparation, using the reference solution as the compensation liquid.

Calculate the anisidine value from the expression:

$$\frac{25 \times (1.2 A_s - A_b)}{m}$$

A_s = absorbance of test solution (b),

A_b = absorbance of test solution (a),

m = mass of the substance to be examined in test solution (a), in grams.

Peroxide value (2.5.5, *Method A*): maximum 10.0.

Unsaponifiable matter (2.5.7): maximum 1.5 per cent, determined on 5.0 g.

Figure 1912.-1. – Chromatogram of the test for oligomers in fish oil rich in omega-3 acids

Figure 1912.-2. – Chromatogram for the assay of total omega-3 acids in fish oil rich in omega-3 acids

Stearin. 100 ml remains clear after cooling at 0 °C for 3 h.

Oligomers. Size-exclusion chromatography (2.2.30).

Test solution. Dilute 10.0 mg of the substance to be examined to 10.0 ml with *tetrahydrofuran R*.

Reference solution. In a 100 ml volumetric flask dissolve 50 mg of *monodocosahexaenoin R*, 30 mg of *didocosahexaenoin R* and 20 mg of *tridocosahexaenoin R* in *tetrahydrofuran R* and dilute to 100.0 ml with the same solvent.

Column 1:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 10 nm.

Columns 2 and 3, placed closest to the injector:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 50 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 0.8 ml/min.

Detection: differential refractometer.

Injection: 40 μ l.

System suitability: reference solution:

- **elution order:** tridocosahexaenoin, didocosahexaenoin, monodocosahexaenoin.
- **resolution:** minimum of 2.0 between the peaks due to monodocosahexaenoin and to didocosahexaenoin and minimum of 1.0 between the peaks due to didocosahexaenoin and to tridocosahexaenoin.

Identify the peaks from the chromatogram (Figure 1912.-1). Calculate the percentage content of oligomers using the following expression:

$$\frac{B}{A} \times 100$$

A = sum of the areas of all the peaks in the chromatogram,

B = area of the peak with a retention time less than the retention time of the triglyceride peak.

Limit:

- **oligomers:** maximum 1.5 per cent.

ASSAY

EPA and DHA (2.4.29). See Figure 1912.-2.

Total omega-3-acids (2.4.29). See Figure 1912.-2.

STORAGE

In an airtight, well-filled container, protected from light, under inert gas.

LABELLING

The label states:

- the concentration of EPA, DHA and total omega-3-acids, expressed as triglycerides,
- the name and the concentration of any added antioxidant.

01/2005:1324

FLECAINIDE ACETATE

Flecainidi acetat

C₁₉H₂₄F₆N₂O₅M_r 474.4

DEFINITION

Flecainide acetate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of *N*[(*RS*)-(piperidin-2-ylmethyl)]-2,5-bis(2,2,2-trifluoroethoxy)benzamide acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very hygroscopic, soluble in water and in ethanol. It is freely soluble in dilute acetic acid and practically insoluble in dilute hydrochloric acid.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- Melting point (2.2.14): 146 °C to 152 °C. The melting range is not greater than 3 °C.
- Dissolve 50 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 298 nm. The specific absorbance at the maximum is 61 to 65.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flecainide acetate CRS*.
- It gives reaction (b) of acetates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.25 g in *water R*, add 0.05 ml of *glacial acetic acid R* and dilute to 10 ml with *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 6.7 to 7.1.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *flecainide acetate CRS* and 25 mg of *flecainide impurity A CRS* in *methanol R* and dilute to 25.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min:

Mobile phase A. Mix 2 ml of *concentrated ammonia R*, 4 ml of *triethylamine R* and 985 ml of *water R*. Add 6 ml of *phosphoric acid R* and adjust to pH 2.8 with *concentrated ammonia R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
	90	10	equilibration
0 - 12	90 → 30	10 → 70	linear gradient
12 - 17	30	70	isocratic
17 - 19	30 → 90	70 → 10	linear gradient
19 - 21	90	10	re-equilibration

- as detector a spectrophotometer set at 300 nm,
- a loop injector.

If a suitable baseline cannot be obtained, use another grade of triethylamine. Inject 20 µl of reference solution (b). The test is not valid unless the resolution between the two peaks in the chromatogram obtained is at least four. Inject 20 µl of the test solution and 20 µl of reference solution (a).

In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the peaks apart from the principal peak is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.02 times that of the principal peak in the chromatogram obtained with reference solution (a).

Impurity B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 10 mg of *flecainide impurity B CRS* in *methanol R* and dilute to 100 ml with the same solvent (solution A). Dissolve 0.10 g of *flecainide acetate CRS* in solution A and dilute to 2 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a freshly prepared mixture of 5 volumes of *concentrated ammonia R* and 95 volumes of *acetone R*. Dry the plate at 100 °C to 105 °C until the ammonia has evaporated and examine in ultraviolet light at 254 nm to establish the position of the flecainide spot. Then spray with a freshly prepared 2 g/l solution of *ninhydrin R* in *methanol R* and heat at 100 °C to 110 °C for 2 min

to 5 min and examine in daylight. In the chromatogram obtained with the test solution, any spot corresponding to impurity B is not more intense than the spot corresponding to impurity B in the chromatogram obtained with the reference solution (0.2 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent determined on 1.000 g by drying in an oven at 60 °C under a pressure not exceeding 0.6 kPa for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.400 g in 25 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 47.44 mg of $C_{19}H_{24}F_6N_2O_5$.

STORAGE

Store protected from light.

IMPURITIES

- A. (8aRS)-3-[2,5-bis(2,2,2-trifluoroethoxy)phenyl]-1,5,6,7,8,8a-hexahydroimidazo[1,5-a]pyridine,

- B. (RS)-(piperidin-2-yl)methanamine,

- C. (RS)-4-hydroxy-N-(piperidin-2-ylmethyl)-2,5-bis(2,2,2-trifluoroethoxy)benzamide,

- D. 2,5-bis(2,2,2-trifluoroethoxy)benzoic acid,

- E. N-(pyridin-2-ylmethyl)-2,5-bis(2,2,2-trifluoroethoxy)benzamide.

01/2005:1721

FLUBENDAZOLE

Flubendazolum

$C_{16}H_{12}FN_3O_3$

M_r 313.3

DEFINITION

Methyl [5-(4-fluorobenzoyl)-1H-benzimidazol-2-yl]carbamate

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24), without recrystallisation.

Comparison: flubendazole CRS.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *dimethylformamide* R and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of flubendazole for system suitability CRS in *dimethylformamide* R and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide* R. Dilute 5.0 ml of this solution to 20.0 ml with *dimethylformamide* R.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octadecylsilyl silica gel for chromatography R (3 μ m),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: 7.5 g/l solution of ammonium acetate R,
- mobile phase B: acetonitrile R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	90 → 75	10 → 25
15 - 30	75 → 45	25 → 55
30 - 32	45 → 10	55 → 90
32 - 37	10	90
37 - 38	10 → 90	90 → 10
38 - 42	90	10

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 µl.

System suitability: reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with *flubendazole* for system suitability CRS.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.4; impurity C = 1.3; impurity D = 1.3; impurity G = 1.4,
- impurities A, B, C, D, E, G: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- impurity F: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- any other impurity with a relative retention between 1.2 and 1.3: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- total: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- disregard limit: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C, for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 3 ml of *anhydrous formic acid R* and add 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 31.33 mg of C₁₆H₁₂FN₃O₃.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

- A. R1 = R2 = H, R4 = NH-CHO: methyl [5-[4-(formylamino)benzoyl]-1H-benzimidazol-2-yl]carbamate,
 E. R1 = R4 = H, R2 = F: methyl [5-(2-fluorobenzoyl)-1H-benzimidazol-2-yl]carbamate,
 F. R1 = CH₃, R2 = H, R4 = F: methyl [5-(4-fluorobenzoyl)-1-methyl-1H-benzimidazol-2-yl]carbamate,
 G. R1 = R2 = H, R4 = O-CH(CH₃)₂: methyl [5-[4-(1-methylethoxy)benzoyl]-1H-benzimidazol-2-yl]carbamate,

- B. R = NH₂: (2-amino-1H-benzimidazol-5-yl)(4-fluorophenyl)methanone,
 C. R = OH: (4-fluorophenyl)(2-hydroxy-1H-benzimidazol-5-yl)methanone,
 D. R = H: (1H-benzimidazol-5-yl)(4-fluorophenyl)methanone.

01/2005:0668

FLUCLOXACILLIN SODIUM

Flucloxacillinum natricum

C₁₉H₁₆ClFN₃NaO₅S·H₂O

M_r 493.9

DEFINITION

Flucloxacillin sodium contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of sodium (2S,5R,6R)-6-[[[3-(2-chloro-6-fluorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water and in methanol, soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flucloxacillin sodium CRS*.

B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.

Reference solution (a). Dissolve 25 mg of *flucloxacillin sodium CRS* in 5 ml of *water R*.

Reference solution (b). Dissolve 25 mg of *cloxacillin sodium CRS*, 25 mg of *dicloxacillin sodium CRS* and 25 mg of *flucloxacillin sodium CRS* in 5 ml of *water R*.

Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R* adjusted to pH 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the colour of the solution is slightly greenish-yellow. Place the test-tube in a water-bath for 1 min; the solution becomes yellow.
- D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 430 nm is not greater than 0.04.

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 158 to + 168, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject test solution (a) and continue the chromatography for five times the retention time of the principal peak. Inject reference solution (b). In the chromatogram obtained with test solution (a): the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

***N,N*-Dimethylaniline (2.4.26, Method B).** Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.8 per cent *m/m*.

Water (2.5.12): 3.0 per cent to 4.5 per cent, determined on 0.300 g by the semi-micro determination of water.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of a solution in *water for injections R* containing 20 mg of the substance to be examined per millilitre.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *flucloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *flucloxacillin sodium CRS* and 5 mg of *cloxacillin sodium CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 25 volumes of *acetonitrile R* and 75 volumes of a 2.7 g/l solution of *potassium dihydrogen phosphate R*; adjust to pH 5.0 with *dilute sodium hydroxide solution R*,
- as detector a spectrophotometer set at 225 nm,
- a 20 µl loop injector.

Inject reference solution (c). Adjust the sensitivity of the system so that the heights of the principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for flucloxacillin is at most 1.0 per cent. Inject alternately test solution (b) and reference solution (a).

STORAGE

Store in an airtight container, at a temperature not exceeding 25 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

IMPURITIES

- A. R = CO₂H: (4*S*)-2-[carboxy[[[3-(2-chloro-6-fluorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of flucloxacillin),
- B. R = H: (2*RS*,4*S*)-2-[[[[3-(2-chloro-6-fluorophenyl)-5-methylisoxazol-4-yl]carbonyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of flucloxacillin),

- C. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- D. 3-(2-chloro-6-fluorophenyl)-5-methylisoxazole-4-carboxylic acid.

01/2005:0766

FLUCYTOSINE

Flucytosinum

C₄H₄FN₃OM_r 129.1

DEFINITION

Flucytosine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-amino-5-fluoropyrimidin-2(1*H*)-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, slightly soluble in ethanol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flucytosine CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the solution changes from red to yellow.

- To 5 ml of solution S (see Tests) add 0.15 ml of *bromine water R* and shake. The colour of the solution is discharged.

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ or Y₇ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 50 mg of the substance to be examined in a mixture of 10 volumes of *water R* and 15 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 10 volumes of *water R* and 15 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *flucytosine CRS* in a mixture of 10 volumes of *water R* and 15 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of test solution (b) to 100 ml with a mixture of 10 volumes of *water R* and 15 volumes of *methanol R*.

Reference solution (c). Dissolve 5 mg of *fluorouracil CRS* in 5 ml of reference solution (a).

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm in an unsaturated tank using a mixture of 1 volume of *anhydrous formic acid R*, 15 volumes of *water R*, 25 volumes of *methanol R* and 60 volumes of *ethyl acetate R*. Allow the solvents to evaporate. At the bottom of a chromatography tank place an evaporating dish containing a mixture of 2 volumes of a 15 g/l solution of *potassium permanganate R*, 1 volume of *hydrochloric acid R1* and 1 volume of *water R*, close the tank and allow to stand for 15 min. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 5 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of the coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Spray with *potassium iodide and starch solution R*. Examine the plate in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Fluoride. Not more than 200 ppm. Carry out a potentiometric determination of fluoride ion, using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

Prepare and store all solutions in plastic containers.

Buffer solution. Dissolve 58 g of *sodium chloride R* in 500 ml of *water R*. Add 57 ml of *glacial acetic acid R* and 200 ml of a 100 g/l solution of *cyclohexylenedinitrilotetra-acetic acid R* in 1 *M sodium hydroxide*. Adjust the pH to 5.0 to 5.5 with a 200 g/l solution of *sodium hydroxide R* and dilute to 1000.0 ml with *water R*.

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Dissolve 4.42 g of *sodium fluoride R*, previously dried at 120 °C for 2 h, in 300 ml of *water R* and dilute to 1000.0 ml with the same solvent (solution (a): 1.9 g/l of fluoride). Prepare three reference solutions by dilution of solution (a) 1 in 100, 1 in 1000 and 1 in 10 000.

To 20.0 ml of each reference solution, add 10.0 ml of the buffer solution and stir with a magnetic stirrer. Introduce the electrodes into the solution and allow to stand for 5 min with constant stirring. Determine the potential difference between the electrodes. Plot on semi-logarithmic graph paper the potential difference obtained for each solution as a function of concentration of fluoride. Using exactly the same conditions, determine the potential difference obtained with the test solution and calculate the content of fluoride.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Use *aplatinum crucible*. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.100 g in 40 ml of *anhydrous acetic acid R* and add 100 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 12.91 mg of $C_{23}H_{31}FN_3O_6$.

STORAGE

Store protected from light.

01/2005:0767

FLUDROCORTISONE ACETATE

Fludrocortisoni acetat

$C_{23}H_{31}FN_3O_6$

M_r 422.5

DEFINITION

Fludrocortisone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11 β ,17-dihydroxy-3,20-dioxopregn-4-en-21-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in ethanol.

IDENTIFICATION

First identification: A, B.

Second identification: C, D, E.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fludrocortisone acetate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance

to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness and record the spectra again using the residues.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *fludrocortisone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5 mg of *cortisone acetate CRS* in 5 ml of reference solution (a).

Apply separately to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent. (This solution is also used to prepare test solution (b)). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* through the solution for 5 min. Stopper the tube. Heat on a water-bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

Reference solution (a). Dissolve 25 mg of *fludrocortisone acetate CRS* in *methanol R* and dilute to 5 ml with the same solvent. (This solution is also used to prepare reference solution (b)). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* through the solution for 5 min. Stopper the tube. Heat on a water bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have R_f values distinctly lower than those of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the solution changes from red to yellow.

E. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 148 to + 156, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.0 mg of *fludrocortisone acetate CRS* and 2.0 mg of *hydrocortisone acetate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.2 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R*,
- as mobile phase at a flow rate of 1 ml/min a mixture of 35 volumes of *tetrahydrofuran R* and 65 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm.

Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the conditions described above the retention times are: hydrocortisone acetate about

8.5 min and fludrocortisone acetate about 10 min. The test is not valid unless the resolution between the peaks corresponding to hydrocortisone acetate and fludrocortisone acetate is at least 1.0; if this resolution is not achieved, adjust slightly the concentration of tetrahydrofuran in the mobile phase. Increasing the concentration of tetrahydrofuran reduces the retention times.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all such peaks, is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 10.0 mg of the substance to be examined in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238 nm.

Calculate the content of $C_{23}H_{31}FO_6$ taking the specific absorbance to be 405.

01/2005:1326

FLUMAZENIL

Flumazenilum

$C_{15}H_{14}FN_3O_3$

M_r 303.3

DEFINITION

Ethyl 8-fluoro-5-methyl-6-oxo-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in methylene chloride, sparingly soluble in methanol.

mp: 198 °C to 202 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of flumazenil.*

TESTS

Appearance of solution. The solution is clear (2.2.1) and is not more intensely coloured than reference solution BY₇ (2.2.2, Method II).

Dissolve 0.10 g in *methanol R* and dilute to 10 ml with the same solvent.

Impurity C: maximum 1 per cent.

Dissolve 0.10 g in 0.5 ml of *methylene chloride R* and dilute to 10 ml with *butanol R*. To 5.0 ml of this solution add 2.0 ml of *ninhydrin solution R* and heat in a water-bath at 95 °C for 15 min. Any blue-purple colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 5.0 ml of a 0.1 g/l solution of *dimethylformamide diethylacetal R* in *butanol R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 5 ml of *methanol R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.0 mg of *flumazenil impurity B CRS* and 2.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 10.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* end-capped octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: to 800 ml of *water R* adjusted to pH 2.0 with *phosphoric acid R*, add 130 ml of *methanol R* and 70 ml of *tetrahydrofuran R* and mix.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of flumazenil.

Relative retention with reference to flumazenil (retention time = about 14 min): impurity A = about 0.4; impurity D = about 0.5; impurity E = about 0.6; impurity B = about 0.7; impurity F = about 2.4.

System suitability: reference solution (a):

- *resolution:* minimum 3.0 between the peaks due to impurity B and flumazenil.

Limits:

- *impurity B:* not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *any other impurity:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total:* not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.250 g in 50 ml of a mixture of 2 volumes of *acetic anhydride R* and 3 volumes of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.33 mg of $C_{15}H_{14}FN_3O_3$.

IMPURITIES

Specified impurities: B, C.

Other detectable impurities: A, D, E, F.

A. R = H, R' = F: 8-fluoro-5-methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylic acid,

B. R = C_2H_5 , R' = OH: ethyl 8-hydroxy-5-methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate,

E. R = C_2H_5 , R' = H: ethyl 5-methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate,

F. R = C_2H_5 , R' = Cl: ethyl 8-chloro-5-methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate,

C. diethoxy-*N,N*-dimethylmethanamine,

D. 7-fluoro-4-methyl-3,4-dihydro-1*H*-1,4-benzodiazepine-2,5-dione.

01/2005:1517

FLUMEQUINE

Flumequinum

and enantiomer

$C_{14}H_{12}FNO_3$

M_r 261.3

DEFINITION

Flumequine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (RS)-9-fluoro-5-methyl-1-oxo-6,7-dihydro-1*H*,5*H*-benzo[*i*,*j*]quinolizine-2-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A microcrystalline white powder, practically insoluble in water, freely soluble in dilute solutions of alkali hydroxides, sparingly soluble in methylene chloride, very slightly soluble in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with flumequine CRS.
- B. It complies with the test for optical rotation (see Tests).
- C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F_{254} plate R.

Test solution. Dissolve 5 mg of the substance to be examined in 10 ml of methylene chloride R.

Reference solution. Dissolve 5 mg of flumequine CRS in 10 ml of methylene chloride R.

Apply to the plate 5 μ l of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of ammonia R, 10 volumes of water R and 90 volumes of alcohol R. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Mix about 5 mg with 45 mg of heavy magnesium oxide R and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of water R, 0.05 ml of phenolphthalein solution R1 and about 2 ml of dilute hydrochloric acid R to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of alizarin S solution R and 0.1 ml of zirconyl nitrate solution R. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the test solution changes from red to yellow. The colour of the blank solution remains red.

TESTS

Solution S. Dissolve 5.00 g in 0.5 M sodium hydroxide and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 35.0 mg of the substance to be examined in dimethylformamide R and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of flumequine CRS and 5.0 mg of flumequine impurity B CRS in dimethylformamide R and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with dimethylformamide R.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 μ m),
- as mobile phase at a flow rate of 0.8 ml/min a mixture of 49 volumes of methanol R and 51 volumes of a 1.36 g/l solution of potassium dihydrogen phosphate R,
- as detector a spectrophotometer set at 313 nm,
- a 10 μ l loop injector.

Inject reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: impurity B, about 11 min and flumequine, about 13 min. The test is not valid unless the resolution between the peaks corresponding to flumequine and impurity B is at least 2.0.

Inject separately dimethylformamide R as a blank, the test solution and reference solution (b). Continue the chromatography of the test solution for three times the retention time of flumequine. When the chromatograms are recorded in the prescribed conditions, the relative retention time for impurity A is about 0.67 with respect to the flumequine peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak obtained with dimethylformamide and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.500 g in 50 ml of dimethylformamide R. Titrate with 0.1 M tetrabutylammonium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M tetrabutylammonium hydroxide is equivalent to 26.13 mg of C₁₄H₁₂FNO₃.

IMPURITIES

- A. R = R' = H: (RS)-5-methyl-1-oxo-6,7-dihydro-1*H*,5*H*-benzo[*i*,*j*]quinolizine-2-carboxylic acid (defluoroflumequine),
- B. R = C₂H₅, R' = F: ethyl (RS)-9-fluoro-5-methyl-1-oxo-6,7-dihydro-1*H*,5*H*-benzo[*i*,*j*]quinolizine-2-carboxylate (flumequine ethyl ester).

01/2005:1327

FLUMETASONE PIVALATE

Flumetasoni pivalas

 $C_{27}H_{36}F_2O_6$ M_r 494.6

DEFINITION

Flumetasone pivalate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 6 α ,9-difluoro-11 β ,17-dihydroxy-16 α -methyl-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in acetone, slightly soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flumetasone pivalate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness on a water-bath and record new spectra using the residues.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *flumetasone pivalate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *desoxycortone acetate CRS* in *acetone R* and dilute to 10 ml with the same solvent. Dilute 5 ml of the solution to 10 ml with reference solution (a).

Apply to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar

in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Add about 2 mg to 2 ml of a mixture of 0.5 ml of *water R* and 1.5 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a pink colour develops. Add the solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains.
- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution RI* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R* add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Solution S. Dissolve 0.50 g in *acetone R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7): + 69 to + 77, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *dexamethasone pivalate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Take 5.0 ml of the solution, add 5.0 ml of the test solution, mix and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 0.6 ml/min a mixture of 5 volumes of *tetrahydrofuran R*, 30 volumes of *acetonitrile R*, 30 volumes of *water R* and 35 volumes of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 μ l of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 μ l of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the relative retention time of dexamethasone pivalate, relative to flumetasone pivalate, is about 1.1. The test is not valid unless in the chromatogram obtained with reference solution (a) the resolution between the peaks corresponding to dexamethasone pivalate and flumetasone pivalate is at least 2.8. If necessary adjust the concentration of tetrahydrofuran in the mobile phase.

Inject 20 µl of the test solution. Continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent); the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C for 4 h.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 239 nm.

Calculate the content of $C_{27}H_{36}F_2O_6$ taking the specific absorbance to be 336.

STORAGE

Store protected from light.

IMPURITIES

- A. R1 = H, R2 = F: 6α,9-difluoro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione (flumetasone),
 B. R1 = CO-CH₃, R2 = F: 6α,9-difluoro-11β,17-dihydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl acetate (flumetasone acetate),
 C. R1 = CO-C(CH₃)₃, R2 = H: 9-fluoro-11β,17-dihydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate (dexamethasone pivalate),
 D. R1 = CO-C(CH₃)₃, R2 = Cl: 6α-chloro-9-fluoro-11β,17-dihydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate (chlordexamethasone pivalate).

01/2005:1722

FLUNARIZINE DIHYDROCHLORIDE

Flunarizini dihydrochloridum

$C_{26}H_{28}Cl_2F_2N_2$

M_r 477.4

DEFINITION

1-[Bis(4-fluorophenyl)methyl]-4-[(2*E*)-3-phenylprop-2-enyl]piperazine dihydrochloride.

Content: 99.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: slightly soluble in water, sparingly soluble in methanol, slightly soluble in alcohol and in methylene chloride.

mp: about 208 °C, with decomposition.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of flunarizine dihydrochloride.*

B. Dissolve 25 mg in 2 ml of *methanol R* and add 0.5 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *flunarizine dihydrochloride* for system suitability CRS in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octadecylsilyl silica gel for chromatography R (3 µm).

Mobile phase:

- mobile phase A: solution containing 23.8 g/l of *tetrabutylammonium hydrogen sulphate R* and 7 g/l of *ammonium acetate R*,
- mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12	80 → 40	20 → 60
12 - 15	40	60
15 - 16	40 → 80	60 → 20
16 - 20	80	20

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl.

System suitability: reference solution (a):

- peak-to-valley ratio: minimum 1.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to flunarizine,
- the chromatogram obtained is concordant with the chromatogram supplied with *flunarizine dihydrochloride* for system suitability CRS.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity A by 1.5,
- **impurities A, D:** for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **impurity B:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- **any other impurity:** for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.200 g in 70 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added at the second point of inflexion. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 23.87 mg of $C_{16}H_{12}FN_3O_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. 1-[bis(4-fluorophenyl)methyl]piperazine,

B. R1 = R2 = R3 = H, R4 = C_6H_5 : 1-[(RS)-(4-fluorophenyl)phenylmethyl]-4-[(2E)-3-phenylprop-2-enyl]piperazine,

- C. R1 = F, R2 = R3 = H, R4 = C_6H_5 : 1-[(RS)-(2-fluorophenyl)(4-fluorophenyl)methyl]-4-[(2E)-3-phenylprop-2-enyl]piperazine,
- D. R1 = R4 = H, R2 = F, R3 = C_6H_5 : 1-[bis(4-fluorophenyl)methyl]-4-[(2Z)-3-phenylprop-2-enyl]piperazine.

01/2005:0717

FLUNITRAZEPAM**Flunitrazepamum**
 $C_{16}H_{12}FN_3O_3$
 M_r 313.3
DEFINITION

5-(2-Fluorophenyl)-1-methyl-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone, slightly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur.* reference spectrum of flunitrazepam.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 100.0 mg of the substance to be examined in 10 ml of *acetonitrile R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 4 mg of the substance to be examined and 4 mg of *nitrazepam R* in 5 ml of *acetonitrile R* and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: *methanol R*, *acetonitrile R*, *water R* (50:305:645 V/V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

Run time: 6 times the retention time of flunitrazepam.

Relative retention with reference to flunitrazepam (retention time = about 11 min): impurity A = about 0.2; impurity B = about 0.6; impurity C = about 2.3; impurity D = about 4.0.

System suitability: reference solution (b):

- **resolution:** minimum 4.0 between the peaks due to nitrazepam and flunitrazepam.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity C by 2.44,
- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 20 ml of *anhydrous acetic acid R* and add 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 31.33 mg of $C_{16}H_{12}FN_3O_3$.

STORAGE

Protected from light.

IMPURITIES

- A. R = NH₂: 7-amino-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one (7-aminodemethylflunitrazepam),
- B. R = NO₂: 5-(2-fluorophenyl)-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one (demethylflunitrazepam),

- C. 3-amino-4-(2-fluorophenyl)-1-methyl-6-nitroquinolin-2(1H)-one,

D. (2-fluorophenyl)[2-(methylamino)-5-nitrophenyl]methanone.

01/2005:0494

FLUOCINOLONE ACETONIDE

Fluocinoloni acetonidum

$C_{24}H_{30}F_2O_6$

M_r 452.5

DEFINITION

6 α ,9-Difluoro-11 β ,21-dihydroxy-16 α ,17-(1-methylethylidene-dioxy)pregna-1,4-diene-3,20-dione.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone and in ethanol.

It shows polymorphism.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *fluocinolone acetonide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *ethanol R*, evaporate to dryness and record new spectra using the residues.

- B. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the reference solution (b) is similar in retention time to the peak due to *fluocinolone acetonide CRS* in the chromatogram obtained with the reference solution (a).

TESTS

Specific optical rotation (2.2.7): + 100 to + 104 (dried substance).

Dissolve 0.100 g in *ethanol R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). *Carry out the test protected from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *fluocinolone acetonide CRS* and 2.5 mg of *triamcinolone acetonide R* in 45 ml of *acetonitrile R* and dilute to 100.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: mix 450 ml of *acetonitrile R* with 500 ml of *water R* and allow to equilibrate; adjust the volume to 1000.0 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 238 nm.

Injection: 20 μ l.

Run time: 4 times the retention time of fluocinolone acetonide.

Retention times: triamcinolone acetonide = about 8.5 min; fluocinolone acetonide = about 10 min.

System suitability:

- **resolution:** minimum of 3.0 between the peaks due to triamcinolone acetonide and fluocinolone acetonide in the chromatogram obtained with reference solution (a).

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and not more than 1 such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

ASSAY

Protect the solutions from light throughout the assay.

Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238 nm.

Calculate the content of $C_{27}H_{30}F_2O_6$ taking the specific absorbance to be 355.

STORAGE

Protected from light.

IMPURITIES

- A. R = CO-CO₂H: 6 α ,9-difluoro-11 β -hydroxy-16 α ,17-(1-methylethylidenedioxy)-3,20-dioxopregna-1,4-dien-21-oic acid,

- B. R = CO₂H: 6 α ,9-difluoro-11 β -hydroxy-16 α ,17-(1-methylethylidenedioxy)-3-oxoandrosta-1,4-diene-17 β -carboxylic acid,
D. R = CO-CH=O: 6 α ,9-difluoro-11 β -hydroxy-16 α ,17-(1-methylethylidenedioxy)-3,20-dioxopregna-1,4-dien-21-al,

- C. 6 α ,9-difluoro-11 β ,16 α ,17,21-tetrahydroxypregna-1,4-diene-3,20-dione (fluocinolone),

- E. 9,11 β -epoxy-6 α -fluoro-21-hydroxy-16 α ,17-(1-methylethylidenedioxy)-9 β -pregna-1,4-diene-3,20-dione,

- F. R = R' = H: 6 α -fluoro-21-hydroxy-16 α ,17-(1-methylethylidenedioxy)pregn-4-ene-3,20-dione,
G. R = OH, R' = CO-CH₃: 6 α -fluoro-11 β -hydroxy-16 α ,17-(1-methylethylidenedioxy)-3,20-dioxopregn-4-en-21-yl acetate.

01/2005:1212

FLUCORTOLONE PIVALATE

Fluocortoloni pivalas

$C_{27}H_{37}FO_5$

M_r 460.6

DEFINITION

Fluocortolone pivalate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 6 α -fluoro-11 β -hydroxy-16 α -methyl-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride and in dioxan, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fluocortolone pivalate CRS*.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *fluocortolone pivalate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *norethisterone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. To about 1 mg add 2 ml of a mixture of 2 volumes of *glacial acetic acid R* and 3 volumes of *sulphuric acid R* and heat for 1 minute on a water-bath. A red colour is produced. Add 5 ml of *water R*, the colour changes to violet-red.

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand

for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.25 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 100 to + 105, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 2 mg of *fluocortolone pivalate CRS* and 2 mg of *prednisolone hexanoate CRS* in *acetonitrile R* and dilute to 100 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 25 volumes of *methanol R*, 30 volumes of *acetonitrile R* and 32 volumes of *water R*,
- as detector a spectrophotometer set at 243 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b). The test is not valid unless, in the chromatogram obtained, the resolution between the two principal peaks is at least 5.0. Inject 20 µl of the test solution. Continue the chromatography for twice the retention time of fluocortolone pivalate. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent) and the sum of the areas of any peaks, apart from the principal peak, is not greater than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.025 times that of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 30.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *ethanol R*. Measure the absorbance (2.2.25) at the maximum at 242 nm.

Calculate the content of $C_{27}H_{37}FO_5$ taking the specific absorbance to be 350.

STORAGE

Store protected from light.

IMPURITIES

- A. 6α-fluoro-11β,21-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione (fluocortolone),

- B. 6-hydroperoxy-11β-hydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate,

- C. 6α-fluoro-16α-methyl-3,11,20-trioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate,

- D. 6α-fluoro-11β-hydroxy-16α-methyl-3,20-dioxopregna-4-en-21-yl 2,2-dimethylpropanoate.

01/2005:1213

FLUORESC EIN SODIUM

Fluoresceinum natricum

 $C_{20}H_{10}Na_2O_5$ M_r 376.3

DEFINITION

Fluorescein sodium contains not less than 95.0 per cent and not more than the equivalent of 103.0 per cent of disodium 2-(3-oxo-6-oxido-3*H*-xanthen-9-yl)benzoate, calculated with reference to the dried substance.

CHARACTERS

An orange-red, fine powder, hygroscopic, freely soluble in water, soluble in alcohol, practically insoluble in hexane and in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Dilute 0.1 ml of solution S (see Tests) to 10 ml with *water R*. The solution shows yellowish-green fluorescence. The fluorescence disappears on addition of 0.1 ml of *dilute hydrochloric acid R* and reappears on addition of 0.2 ml of *dilute sodium hydroxide solution R*.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of fluorescein sodium*. Examine the substance prepared as a disc.
- The absorption by a piece of filter paper of 0.05 ml of the solution prepared for identification A (before the addition of *dilute hydrochloric acid R*) colours the paper yellow. On exposing the moist paper to bromine vapour for 1 min and then to ammonia vapour the colour becomes deep pink.
- Ignite 0.1 g in a porcelain crucible. Dissolve the residue in 5 ml of *water R* and filter. 2 ml of the filtrate gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and orange-yellow with yellowish-green fluorescence.

pH (2.2.3). The pH of solution S is 7.0 to 9.0.

Related substances and resorcinol. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a 10 g/l solution of *hydrochloric acid R* in *methanol R* and dilute to 10 ml with the same acidic solution.

Test solution (b). Dissolve 0.250 g of the substance to be examined in 5 ml of *water R*. Transfer to a separating funnel and wash with 3 ml of *water R*. Add 2 ml of *buffer solution pH 8.0 R* and 2.5 g of *sodium chloride R*. Shake until the sodium chloride dissolves. Shake the solution obtained with two quantities, each of 25 ml, of *peroxide-free ether R*. Dry the ether layers over *anhydrous sodium sulphate R* and evaporate to dryness using a rotary evaporator. Dissolve the residue in 10 ml of a 10 g/l solution of *hydrochloric acid R* in *methanol R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with a 10 g/l solution of *hydrochloric acid R* in *methanol R*.

Reference solution (b). Dilute 1 ml of test solution (a) to 50 ml with a 10 g/l solution of *hydrochloric acid R* in *methanol R*. Dilute 1 ml of the solution to 10 ml with a 10 g/l solution of *hydrochloric acid R* in *methanol R*.

Reference solution (c). Dissolve 25 mg of *resorcinol R* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (d). Dilute 10 ml of reference solution (c) to 20 ml with *water R*.

Reference solution (e). To 5 ml of reference solution (c) add 1 ml of test solution (a) and dilute to 10 ml with *methanol R*.

Apply separately to the plate 5 µl of test solutions (a) and (b) and 5 µl of reference solutions (a), (b), (d) and (e). Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 365 nm. Expose the plate to iodine vapour for 30 min and examine in daylight. In the chromatogram obtained with test solution (a): any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.2 per cent). In the chromatogram obtained with test solution (b) any spot corresponding to resorcinol is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows two clearly separated spots. The spots corresponding to resorcinol are visible only after exposing the plate to iodine vapour.

Dimethylformamide. Examine by gas chromatography (2.2.28) using *dimethylacetamide R* as the internal standard.

Internal standard solution. Dilute 20 µl of *dimethylacetamide R* to 100 ml with *water R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in 10 ml of *water R*. Add, with gently stirring, 10 ml of a 60 g/l solution of *hydrochloric acid R*. Allow to stand for 15 min and centrifuge. Dissolve 0.10 g of *trisodium phosphate dodecahydrate R* in 5 ml of the supernatant.

Test solution (b). Dissolve 1.0 g of the substance to be examined in 10 ml of the internal standard solution. Add, with gentle stirring, 10 ml of a 60 g/l solution of *hydrochloric acid R*. Allow to stand for 15 min and centrifuge. Dissolve 0.10 g of *trisodium phosphate dodecahydrate R* in 5 ml of the supernatant.

Reference solution. Dilute 20 µl of *dimethylformamide R* to 10 ml with *water R*. Dilute 1 ml of the solution to 10 ml with *water R*. Add 10 ml of the internal standard solution and mix.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m long and 4 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* (135 µm to 175 µm) impregnated with 10 per cent *m/m* of *macrogol 1000 R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 40 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 120 °C and that of the injection port and of the detector at 170 °C.

Inject 2 µl of each solution. In the chromatogram obtained with test solution (b), the ratio of the area of any peak corresponding to dimethylformamide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (0.2 per cent).

Chlorides (2.4.4). To 10 ml of solution S add 90 ml of *water R* and 1 ml of *dilute nitric acid R*, wait for at least 10 min and filter. 10 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (0.25 per cent).

Sulphates (2.4.13). To 5 ml of solution S add 90 ml of *distilled water R*, 2.5 ml of *dilute hydrochloric acid R*, dilute to 100 ml with *distilled water R* and filter. 15 ml of the filtrate complies with the limit test for sulphates (1.0 per cent).

Zinc. Dilute 5 ml of solution S to 10 ml with *water R*. Add 2 ml of *hydrochloric acid R1*, filter and add 0.1 ml of *potassium ferrocyanide solution R*. No turbidity or precipitate is formed immediately.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 50.0 mg in *water R* and dilute to 500.0 ml with the same solvent. Dilute 5.0 ml of this solution to 200.0 ml with *buffer solution pH 8.0 R*. Measure the absorbance (2.2.25) at the maximum at 492 nm.

Calculate the content of $C_{20}H_{10}Na_2O_5$ taking the specific absorbance to be 2050.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. benzene-1,3-diol (resorcinol).

01/2005:0611

FLUOROURACIL

Fluorouracilum

$C_4H_3FN_2O_2$

M_r 130.1

DEFINITION

Fluorouracil contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 5-fluoropyrimidine-2,4(1*H*,3*H*)-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fluorouracil CRS*.
- B. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. In a test-tube, heat 0.5 ml of *chromic acid cleansing mixture R* in a naked flame until white fumes appear in the upper part of the tube. The solution wets the side of the tube and there is no appearance of greasiness. Add

about 2 mg of the substance to be examined and heat again in a naked flame until white fumes appear. The solution does not wet the sides of the tube.

01/2005:1104

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ or Y₇ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.5 to 5.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (a). Dissolve 20 mg of *fluorouracil CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 200 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (c). Dissolve 5 mg of *5-hydroxyuracil R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 200 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 15 volumes of *methanol R*, 15 volumes of *water R* and 70 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Spray with a freshly prepared 5 g/l solution of *fast blue B salt R* and subsequently with 0.1 M *sodium hydroxide*. Any spot corresponding to 5-hydroxyuracil in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Heavy metals (2.4.8). Use a *platinum crucible*. 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 4 h.

Sulphated ash (2.4.14). Use a *platinum crucible*. Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1000 g in 80 ml of *dimethylformamide R*, warming gently. Cool and titrate with 0.1 M *tetrabutylammonium hydroxide*, using 0.25 ml of a 10 g/l solution of *thymol blue R* in *dimethylformamide R* as indicator. Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 13.01 mg of C₁₇H₁₉ClF₃NO.

STORAGE

Store protected from light.

FLUOXETINE HYDROCHLORIDE

Fluoxetini hydrochloridum

C₁₇H₁₉ClF₃NOM_r 345.8

DEFINITION

Fluoxetine hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (3*RS*)-*N*-methyl-3-phenyl-3-[4-(trifluoromethyl)phenoxy]propan-1-amine hydrochloride, calculated with reference to the anhydrous, acetonitrile-free substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, freely soluble in methanol, sparingly soluble in methylene chloride.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fluoxetine hydrochloride CRS*. Examine the substances prepared as discs.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 4.5 to 6.5.

Optical rotation (2.2.7): −0.05° to +0.05°, determined on solution S.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay, setting the spectrophotometer at 215 nm.

Test solution (a). Dissolve 55.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dilute 2.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution. Dissolve 22.0 mg of *fluoxetine hydrochloride CRS* in 10.0 ml of 0.5 M *sulphuric acid*. Heat at about 85 °C for 3 h. Allow to cool. The resulting solution contains considerable quantities of impurity A and 4-trifluoromethylphenol. To 0.4 ml of the solution, add 28.0 mg of *fluoxetine hydrochloride CRS* and about 1 mg of *fluoxetine impurity B CRS* and of *fluoxetine impurity C CRS* and dilute to 25.0 ml with the mobile phase. When the chromatograms are recorded in the prescribed conditions, the retention times relative to fluoxetine are: impurity A about 0.24, impurity B about 0.27 and impurity C about 0.94.

Inject 10 µl of the reference solution.

The test is not valid unless: in the chromatogram obtained with the reference solution, the retention time of the peak due to fluoxetine is 10 min to 18 min; the retention time of the peak due to 4-trifluoromethylphenol is not greater than 35 min; the h/v ratio is not greater than 1.1 (h is the distance between the top of the peak due to impurity C and the baseline; v is the distance between the top of the peak due to impurity C and the lowest point of the valley defined between the peak due to impurity C and the peak due to fluoxetine). If the ratio is greater than 1.1, reduce the volume of methanol and increase the volume of the solution of triethylamine in the mobile phase.

Inject 10 µl of test solution (a) and 10 µl of test solution (b). Continue the chromatography for 3 times the retention time of fluoxetine.

In the chromatogram obtained with test solution (b), the area of any peak due to impurity C is not greater than 0.0015 times the area of the principal peak (0.15 per cent).

In the chromatogram obtained with test solution (a): the areas of any peaks due to impurity A and impurity B are not greater than 0.0125 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.25 per cent); none of the peaks, except the principal peak and the peaks due to impurity A and impurity B, has an area greater than 0.005 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.025 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.5 per cent).

Disregard any peak with an area less than 0.0025 times that of the principal peak in the chromatogram obtained with test solution (b).

Acetonitrile. Not more than 0.1 per cent, determined by gas chromatography (2.2.28).

Test solution. Dissolve 50 mg of the substance to be examined in *dimethylformamide R* and dilute to 5.0 ml with the same solvent.

Reference solution. To 1.0 g of *acetonitrile R*, add *dimethylformamide R*, mix and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 1000.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a fused-silica capillary column 30 m long and about 0.53 mm in internal diameter coated with *macrogol 20 000 R* (1 µm thick),
- *helium for chromatography R* as the carrier gas at a flow rate of 10 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 35 °C for 2 min then raising the temperature at a rate of 15 °C/min to 220 °C and maintaining at 220 °C for 10 min and maintaining the temperature of the injection port and that of the detector at 250 °C.

Inject 1 µl of the test solution, 1 µl of the reference solution and 1 µl of the dissolution solvent. In the chromatogram obtained with the reference solution, note the retention time of acetonitrile.

In the chromatogram obtained with the dissolution solvent, verify that there is no peak with the same retention time as acetonitrile.

The area of the peak due to acetonitrile in the chromatogram obtained with the test solution is not greater than that of the corresponding peak in the chromatogram obtained with the reference solution.

Heavy metals (2.4.8). 1.0 g complies with limit test C (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 55.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. Dissolve 55.0 mg of *fluoxetine hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 8 volumes of *methanol R*, 30 volumes of *tetrahydrofuran R* and 62 volumes of a solution of *triethylamine R* prepared as follows: to 10 ml of *triethylamine R*, add 980 ml of *water R*, mix and adjust to pH 6.0 with *phosphoric acid R* (about 4.5 ml) and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 227 nm.

When using a recorder, adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is at least 50 per cent of the full scale of the recorder.

Adjust the volumes of methanol and the solution of triethylamine in the mobile phase so that the retention time of fluoxetine is between 10 min and 18 min.

The assay is not valid unless the symmetry factor calculated at 10 per cent of the height of the peak due to fluoxetine is at most 2.0.

Inject 10 µl of the test solution and 10 µl of the reference solution.

Calculate the content of fluoxetine hydrochloride ($C_{17}H_{19}ClF_3NO$) from the area of the peaks in the chromatograms obtained with the test solution and the reference solution using the stated content of $C_{17}H_{19}ClF_3NO$ in *fluoxetine hydrochloride CRS* and correcting for the content of water and of acetonitrile in the substance to be examined.

IMPURITIES

A. R = OH: (1*RS*)-3-(methylamino)-1-phenylpropan-1-ol,

B. R = H: *N*-methyl-3-phenylpropan-1-amine,

C. (3*RS*)-*N*-methyl-3-phenyl-3-[3-(trifluoromethyl)phenoxy]propan-1-amine.

01/2005:1693

FLUPENTIXOL DIHYDROCHLORIDE

Flupentixoli dihydrochloridum

$C_{23}H_{27}Cl_2F_3N_2OS$

M_r 507.4

DEFINITION

2-[4-[3-[(*EZ*)-2-(trifluoromethyl)-9*H*-thioxanthen-9-ylidene]propyl]piperazin-1-yl]ethanol dihydrochloride.

Content:

- flupentixol dihydrochloride: 98.0 per cent to 101.5 per cent (dried substance),
- *Z*-isomer: 42.0 per cent to 52.0 per cent.

CHARACTERS

Appearance: white or almost white powder.

Solubility: very soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: flupentixol dihydrochloride CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of flupentixol dihydrochloride CRS in methanol *R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: water *R*, diethylamine *R*, methyl ethyl ketone *R* (1:4:95 V/V/V).

Application: 2 μ l.

Development: twice over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Doubling of the spot may be observed in both chromatograms.

Detection B: spray with alcoholic solution of sulphuric acid *R*; heat at 110 °C for 5 min and allow to cool; examine in ultraviolet light at 365 nm.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Doubling of the spot may be observed in both chromatograms.

C. Mix about 5 mg with 45 mg of heavy magnesium oxide *R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of water *R*, 0.05 ml of phenolphthalein solution *R1* and about 1 ml of dilute hydrochloric acid *R* to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of alizarin *S* solution *R* and 0.1 ml of zirconyl nitrate solution *R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow. The blank is red.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, Method II).

Dissolve 2.0 g of the substance to be examined in water *R* and dilute to 20 ml with the same solvent.

pH (2.2.3): 2.0 to 3.0.

Dissolve 0.5 g in carbon dioxide-free water *R* and dilute to 50 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27). Carry out the test protected from light and prepare the solutions immediately before use.

Test solution (a). Dissolve 0.40 g of the substance to be examined in alcohol *R* and dilute to 20 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 20.0 ml with alcohol *R*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 50.0 ml with alcohol *R*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 20.0 ml with alcohol *R*.

Reference solution (c). Dissolve 10 mg of flupentixol impurity D CRS in alcohol *R*, add 0.5 ml of test solution (a) and dilute to 20.0 ml with alcohol *R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: diethylamine *R*, toluene *R*, ethyl acetate *R* (10:20:70 V/V/V).

Application: 5 μ l.

Development: in an unsaturated tank over a path of 10 cm.

Drying: in air.

Detection: spray with alcoholic solution of sulphuric acid *R*, heat at 110 °C for 5 min and allow to cool; examine in ultraviolet light at 365 nm. Doubling of the spot due to flupentixol may be observed.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limits:

- in the chromatogram obtained with test solution (a): any spots, apart from the principal spot, are not more intense than the spot, or spots in the chromatogram obtained with reference solution (a) (0.2 per cent),

- in the chromatogram obtained with test solution (b): any spots, apart from the principal spot, are not more intense than the spot or spots in the chromatogram obtained with reference solution (b) (0.2 per cent).

Impurity F. Liquid chromatography (2.2.29). Carry out the test protected from light and prepare the solutions immediately before use.

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution. Dissolve 10.0 mg of flupentixol dihydrochloride CRS and 10.0 mg of flupentixol impurity F CRS in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Column:

- size: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (3 μ m)

Mobile phase: mix 10 volumes of acetonitrile R, 55 volumes of methanol R and 35 volumes of a solution containing 8.72 g/l of potassium dihydrogen phosphate R, 0.37 g/l of anhydrous disodium hydrogen phosphate R and 0.77 g/l of dodecyltrimethylammonium bromide R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 μ l.

System suitability: reference solution:

- resolution: minimum 2.0 between the 2nd of the peaks due to impurity F and the 1st of the peaks due to flupentixol. Peak splitting may not always occur.

Limit:

- impurity F: not more than the area of the corresponding peak or peaks in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Flupentixol dihydrochloride. Dissolve 0.200 g in 30 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 50.74 mg of C₂₃H₂₇Cl₂F₃N₂OS.

Z-Isomer. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dissolve 20.0 mg of flupentixol dihydrochloride CRS in the mobile phase and dilute to 50.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.0$ mm,

- stationary phase: silica gel for chromatography R (5 μ m).

Mobile phase: water R, concentrated ammonia R, 2-propanol R, heptane R (2:4:150:850 V/V/V/V).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

System suitability: reference solution:

- resolution: minimum 3.0 between the peaks due to Z-isomer (1st peak) and to E-isomer (2nd peak).

Results:

- calculate the percentage content of Z-isomer taking into account the assigned content of Z-isomer in flupentixol dihydrochloride CRS,
- calculate the ratio of the area of the peak due to the E-isomer to the area of the peak due to the Z-isomer: this ratio is 0.9 to 1.4.

STORAGE

Protected from light.

FLUPHENAZINE DECANOATE

Fluphenazini decanoas

$C_{32}H_{44}F_3N_3O_2S$

M_r 591.8

DEFINITION

2-[4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl]piperazin-1-yl]ethyl decanoate.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: pale yellow, viscous liquid or yellow solid.

Solubility: practically insoluble in water, very soluble in ethanol and in methylene chloride, freely soluble in methanol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C.

A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 50.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 260 nm and a broad absorption maximum at about 310 nm. The specific absorbance at the maximum at 260 nm is 570 to 630.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: apply 50 µl of a 25 g/l solution in *methylene chloride R* to a disc of *potassium bromide R*. Dry the discs at 60 °C for 1 h before use.

Comparison: fluphenazine decanoate CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of fluphenazine decanoate CRS in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of fluphenazine enantate CRS in reference solution (a) and dilute to 5 ml with the same solution.

Plate: TLC octadecylsilyl silica gel F_{254} plate R.

Mobile phase: concentrated ammonia R1, water R, *methanol R* (1:4:95 V/V/V).

Application: 2 µl.

Development: over a path of 8 cm.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Liquid chromatography (2.2.29). Carry out the test protected from light and prepare the solutions immediately before use.

Test solution. Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of fluphenazine octanoate CRS and 5 mg of fluphenazine enantate CRS in *acetonitrile R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B.

Reference solution (c). Dissolve 11.7 mg of fluphenazine dihydrochloride CRS and 5.0 mg of fluphenazine sulphoxide CRS in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml to 50.0 ml with a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase:

- mobile phase A: 10 g/l solution of ammonium carbonate R adjusted to pH 7.5 with dilute hydrochloric acid R,
- mobile phase B: mobile phase A, *acetonitrile R*, *methanol R* (7.5:45:45 V/V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 7	20	80
7 - 17	20 → 0	80 → 100
17 - 80	0	100
80 - 81	0 → 20	100 → 80

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 260 nm.

01/2005:1015

Equilibration: at least 30 min with the mobile phase at the initial composition.

Injection: 10 µl.

Relative retention with reference to fluphenazine decanoate (retention time = about 34 min): impurity A = about 0.13; impurity B = about 0.33; impurity C = about 0.76; impurity D = about 0.82.

System suitability: reference solution (a):

- **resolution:** minimum 6 between the peaks due to impurity C and impurity D.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **impurity B:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total:** not more than 2.0 per cent,
- **disregard limit for any other impurity:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.250 g in 30 ml of *glacial acetic acid* R. Using 0.05 ml of *crystal violet solution* R as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from violet to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 29.59 mg of C₂₉H₃₈F₃N₃O₂S.

STORAGE

Protected from light.

IMPURITIES

- X = SO, R = H: fluphenazine S-oxide,
- X = S, R = H: fluphenazine,
- X = S, R = CO-[CH₂]₅-CH₃: fluphenazine enantate,

01/2005:0904

FLUPHENAZINE HYDROCHLORIDE

Fluphenazini hydrochloridum

 $C_{22}H_{28}Cl_2F_3N_3OS$
 M_r 510.5

DEFINITION

Fluphenazine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-[4-[3-[2-(trifluoromethyl)-10H-phenothiazin-10-yl]propyl]piperazin-1-yl]ethanol dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 260 nm and a broad absorption maximum at about 310 nm. The specific absorbance at the maximum at 260 nm is 630 to 700.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fluphenazine hydrochloride CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
Reference solution (a). Dissolve 20 mg of *fluphenazine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.
Reference solution (b). Dissolve 10 mg of *perphenazine CRS* in reference solution (a) and dilute to 5 ml with the same solution.
 Apply to the plate 2 µl of each solution. Develop twice over a path of 15 cm using a mixture of 1 volume of *water R*, 4 volumes of *diethylamine R* and 95 volumes of *methyl ethyl ketone R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.
- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.
- E. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in 10 ml of *carbon dioxide-free water R*. The pH of the solution is 1.9 to 2.4.

Related substances. Carry out the test protected from light and prepare the solutions immediately before use. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in

ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 65 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.220 g in a mixture of 10 ml of *anhydrous formic acid R* and 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.52 mg of C₂₂H₂₈Cl₂F₃N₃OS.

STORAGE

Store protected from light.

IMPURITIES

A. fluphenazine S-oxide.

01/2005:0905

FLURAZEPAM MONOHYDROCHLORIDE

Flurazepami monohydrochloridum

C₂₁H₂₄Cl₂FN₃O

M_r 424.3

DEFINITION

7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one monohydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of flurazepam monohydrochloride.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 5.0 to 6.0.

Dissolve 0.50 g in carbon dioxide-free water R and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 5 mg of oxazepam R in 10 ml of acetonitrile R and dilute to 50.0 ml with the mobile phase.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix 350 volumes of acetonitrile R and 650 volumes of a 10.5 g/l solution of potassium dihydrogen phosphate R and adjust to pH 6.1 with a 40 g/l solution of sodium hydroxide R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 239 nm.

Injection: 20 μ l.

Run time: 6 times the retention time of flurazepam.

Relative retention with reference to flurazepam (retention time = about 7 min): impurity C = about 1.5; impurity B = about 1.9; impurity A = about 2.4.

System suitability: reference solution (b):

- resolution: minimum of 4.5 between the peaks due to flurazepam and to oxazepam.

Limits:

- *correction factors:* for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.61; impurity C = 0.65,
- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total:* not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Fluorides (2.4.5): maximum 500 ppm.

0.10 g complies with the limit test for fluorides.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in a mixture of 1.0 ml of 0.1 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 42.43 mg of $C_{21}H_{24}Cl_2FN_3O$.

STORAGE

Protected from light.

IMPURITIES

A. [5-chloro-2-[[2-(diethylamino)ethyl]amino]phenyl](2-fluorophenyl)methanone,

B. R = H: 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

C. R = CHOH-CH_3 : 7-chloro-5-(2-fluorophenyl)-1-[(1R)-1-hydroxyethyl]-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

01/2005:1519

FLURBIPROFEN

Flurbiprofenum

and enantiomer

 $C_{15}H_{13}FO_2$
 M_r 244.3

DEFINITION

Flurbiprofen contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2RS)-2-(2-fluorobiphenyl-4-yl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in alcohol and in methylene chloride. It dissolves in aqueous solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

- A. Melting point (2.2.14): 114 °C to 117 °C.
- B. Dissolve 0.10 g in 0.1 M sodium hydroxide and dilute to 100.0 ml with the same alkaline solution. Dilute 1.0 ml of the solution to 100.0 ml with 0.1 M sodium hydroxide. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 247 nm. The specific absorbance at the maximum is 780 to 820.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with flurbiprofen CRS.
- D. Mix about 5 mg with 45 mg of heavy magnesium oxide R and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of water R, 0.05 ml of phenolphthalein solution R1 and about 1 ml of dilute hydrochloric acid R to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of alizarin S solution R and 0.1 ml of zirconyl nitrate solution R add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. Dissolve 1.0 g in methanol R and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, Method I).

Optical rotation (2.2.7). Dissolve 0.50 g in methanol R and dilute to 20.0 ml with the same solvent. The angle of optical rotation is -0.1° to $+0.1^{\circ}$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 45 volumes of acetonitrile R and 55 volumes of water R and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of 45 volumes of acetonitrile R and 55 volumes of water R. Dilute 1.0 ml of the solution to 10.0 ml with a mixture of 45 volumes of acetonitrile R and 55 volumes of water R.

Reference solution (b). Dissolve 10.0 mg of flurbiprofen impurity A CRS in a mixture of 45 volumes of acetonitrile R and 55 volumes of water R and dilute to 100.0 ml with the same mixture of solvents. Dilute 10.0 ml of this solution to 100.0 ml with a mixture of 45 volumes of acetonitrile R and 55 volumes of water R.

Reference solution (c). Dissolve 10 mg of the substance to be examined in a mixture of 45 volumes of acetonitrile R and 55 volumes of water R and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 10.0 ml with reference solution (b).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of glacial acetic acid R, 35 volumes of acetonitrile R and 60 volumes of water R,
- as detector a spectrophotometer set at 254 nm.

Inject 10 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are at least 40 per cent of

the full scale of the recorder. The test is not valid unless the resolution between the peak corresponding to impurity A and the peak corresponding to flurbiprofen is at least 1.5.

Inject 10 µl of the test solution and of reference solutions (a) and (b). Continue the chromatography for twice the retention time of flurbiprofen. In the chromatogram obtained with the test solution the area of any peak corresponding to impurity A is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the area of any peak, apart from the principal peak and the peak due to impurity A, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of any such peaks is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.4.8). Dissolve 2.0 g in a mixture of 10 volumes of water R and 90 volumes of methanol R and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting lead standard solution (100 ppm Pb) R with a mixture of 10 volumes of water R and 90 volumes of methanol R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.200 g in 50 ml of alcohol R. Titrate with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M sodium hydroxide is equivalent to 24.43 mg of C₁₅H₁₃FO₂.

IMPURITIES

- A. R = R' = H: (2*RS*)-2-(biphenyl-4-yl)propanoic acid,
- B. R = CH(CH₃)-CO₂H: 2-(2-fluorobiphenyl-4-yl)-2,3-dimethylbutanedioic acid,
- C. R = OH, R' = F: (2*RS*)-2-(2-fluorobiphenyl-4-yl)-2-hydroxypropanoic acid,

- D. R = CO-CH₃: 1-(2-fluorobiphenyl-4-yl)ethanone,
- E. R = CO₂H: 2-fluorobiphenyl-4-carboxylic acid.

01/2005:1723 – stationary phase: octadecylsilyl silica gel for chromatography R (3 µm).

FLUSPIRILENE

Fluspirilenum

C₂₉H₃₁F₂N₃O

M_r 475.6

DEFINITION

8-[4,4-bis(4-Fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in methylene chloride, slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: fluspirilene CRS.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, gently evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Dissolve 0.25 g in 25 ml of *methylene chloride R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *fluspirilene impurity C CRS* in *dimethylformamide R*, add 0.5 ml of the test solution and dilute to 100.0 ml with *dimethylformamide R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *dimethylformamide R*. Dilute 1.0 ml of this solution to 25.0 ml with *dimethylformamide R*.

Column:

– size: *l* = 0.15 m, Ø = 4.6 mm,

Mobile phase:

– mobile phase A: 13.6 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

– mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	75 → 70	25 → 30
15 - 20	70	30
20 - 22	70 → 0	30 → 100
22 - 30	0	100
30 - 31	0 → 75	100 → 25
31 - 40	75	25

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 µl.

Relative retention with reference to fluspirilene (retention time = about 15 min): impurity A = about 0.8; impurity B = about 0.93; impurity C = 0.97.

System suitability: reference solution (a):

– resolution: minimum 2.2 between the peaks due to impurity C and fluspirilene.

Limits:

- impurities A, B, C: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- any other impurity: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.350 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 47.56 mg of C₂₉H₃₁F₂N₃O.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

- A. R1 = R2 = R3 = H: 8-[(4*RS*)-4-(4-fluorophenyl)-4-phenylbutyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,
- B. R1 = R3 = H, R2 = F: 8-[(4*RS*)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,
- C. R1 = CH₂OH, R2 = H, R3 = F: 8-[4,4-bis(4-fluorophenyl)butyl]-3-(hydroxymethyl)-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

01/2005:1423

FLUTAMIDE

Flutamidum

C₁₁H₁₁F₃N₂O₃M_r 276.2

DEFINITION

Flutamide contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 2-methyl-*N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide, calculated with reference to the dried substance.

CHARACTERS

A pale yellow, crystalline powder, practically insoluble in water, freely soluble in acetone and in alcohol.

It melts at about 112 °C.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flutamide CRS*.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *flutamide CRS* and 2 mg of *flutamide impurity C CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.5 ml/min a mixture of equal volumes of *acetonitrile R* and *water R*,
- as detector a spectrophotometer set at 240 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is not less than 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: flutamide about 19 min and impurity C about 14 min. The test is not valid unless the resolution between the peaks corresponding to impurity C and flutamide is at least 10.5.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of the peak corresponding to impurity C, with a retention time of about 0.72 relative to flutamide, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent); the area of any other peak apart from the principal peak and the peak corresponding to impurity C is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the sum of the areas of the peaks apart from the principal peak is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 25.0 mg in *methanol R* and dilute to 25.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the maximum at 295 nm.

Calculate the content of C₁₁H₁₁F₃N₂O₃ taking the specific absorbance to be 295.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H, R' = NO₂: 4-nitro-3-(trifluoromethyl)aniline,
- B. R = CO-CH₃, R' = NO₂: *N*-[4-nitro-3-(trifluoromethyl)phenyl]acetamide,
- C. R = CO-CH₂-CH₃, R' = NO₂: *N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide,
- D. R = R' = H: 3-(trifluoromethyl)aniline,

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 3.5	60
	3.5 - 7.5	60 → 180
	7.5 - 10.5	180
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 0.1 µl.

Limit:

– acetone: maximum 1.0 per cent *m/m*.

Water (2.5.12): maximum 0.5 per cent determined on 0.250 g.

Use as solvent a mixture of equal volumes of *chloroform R* and *methanol R*.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *fluticasone propionate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of *fluticasone impurity D CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. To 1.0 ml of this solution, add 1.0 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase.

Column:

- size: *l* = 0.25 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm),
- temperature: 40 °C.

Mobile phase: mix 15 volumes of *acetonitrile R*, 35 volumes of a 1.15 g/l solution of *ammonium dihydrogen phosphate R* adjusted to pH 3.5 and 50 volumes of *methanol R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 239 nm.

Injection: 20 µl; inject the test solution and reference solutions (b) and (c).

System suitability: reference solution (c):

- resolution: minimum 1.5 between the peaks due to impurity D and to fluticasone propionate.

If necessary, adjust the ratio of acetonitrile to methanol in the mobile phase.

Calculate the percentage content of $C_{25}H_{31}F_3O_5S$ using the chromatograms obtained with the test solution and reference solution (b), and the declared content of *fluticasone propionate CRS*.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.

- A. R1 = R3 = OH, R2 = H, R4 = CH₃: 6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-diene-17β-carboxylic acid,
- B. R1 = OH, R2 = H, R3 = S-OH, R4 = CH₃: [[6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-dien-17β-yl]carbonyl]sulphenic acid,
- C. R1 = OH, R2 = R4 = H, R3 = S-CH₂-F: 6α,9-difluoro-17-[(fluoromethyl)sulphonyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl acetate,
- D. R1 = OH, R2 = H, R3 = S-CH₃, R4 = CH₃: 6α,9-difluoro-17-[(methylsulphonyl)carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate,
- F. R1 + R2 = O, R3 = S-CH₂-F, R4 = CH₃: 6α,9-difluoro-17-[(fluoromethyl)sulphonyl]carbonyl]-16α-methyl-3,11-dioxoandrosta-1,4-dien-17α-yl propanoate,

- E. 6α,9-difluoro-17-[(fluoromethyl)sulphonyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate,

- G. 6α,9-difluoro-17-[(fluoromethyl)sulphonyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl 6α,9-difluoro-11β,17-dihydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carboxylate,

- H. X = S-S: 17,17'-(disulphanediyl)dicarbonylbis(6 α ,9-difluoro-11 β -hydroxy-16 α -methyl-3-oxoandrosta-1,4-dien-17 α -yl) dipropanoate,
- I. X = S-S-S: 17,17'-(trisulphanediyl)dicarbonylbis(6 α ,9-difluoro-11 β -hydroxy-16 α -methyl-3-oxoandrosta-1,4-dien-17 α -yl) dipropanoate.

01/2005:1424

FLUTRIMAZOLE

Flutrimazolum

C₂₂H₁₆F₂N₂M_r 346.4

DEFINITION

Flutrimazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (RS)-1-[(2-fluorophenyl)(4-fluorophenyl)phenylmethyl]-1H-imidazole, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in tetrahydrofuran and soluble in methanol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 161 °C to 166 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *flutrimazole CRS*. Examine the substances prepared as discs.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*. Heat the plate at 110 °C for 1 h.

Test solution. Dissolve 20 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *flutrimazole CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *flutrimazole CRS* and 10 mg of *metronidazole benzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 μ l of each solution. Develop over a path corresponding to two-thirds of the height of the plate using a mixture of 10 volumes of *2-propanol R* and 90 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Solution S. Dissolve 1.00 g in *methanol R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.05° to +0.05°.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *imidazole CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 30.0 mg of *flutrimazole impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Mix 2.0 ml of reference solution (a) and 2.0 ml of reference solution (b) and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 10.0 ml of reference solution (c) to 50.0 ml with the mobile phase.

Reference solution (e). Mix 2.0 ml of the test solution and 10.0 ml of reference solution (c) and dilute to 50.0 ml with the mobile phase.

Reference solution (f). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.2 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.3 ml/min a mixture of 40 volumes of 0.03 M *phosphate buffer solution pH 7.0 R* and 60 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 μ l of reference solution (e). The test is not valid unless the resolution between the first peak (imidazole) and the second peak (impurity B) is at least 2.0 and the resolution

01/2005:0067

between the second peak and the third peak (flutrimazole) is at least 1.5. The symmetry factor of the first peak and the second peak is not greater than 2.0.

Inject separately 20 µl of the test solution, 20 µl of reference solution (d) and 20 µl of reference solution (f). Continue the chromatography for 2.5 times the retention time of the principal peak.

In the chromatogram obtained with the test solution:

- the area of the peak due to imidazole is not greater than the corresponding area in the chromatogram obtained with reference solution (d) (0.1 per cent);
- the area of the peak due to impurity B is not greater than the corresponding area in the chromatogram obtained with reference solution (d) (0.3 per cent);
- the area of any peak, apart from the principal peak and any peak corresponding to impurity B, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.1 per cent); the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (f) (0.3 per cent). Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with reference solution (f).

Heavy metals (2.4.8). 2.0 g complies with limit test F for heavy metals (10 ppm). Use a platinum crucible. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 34.64 mg of C₁₉H₁₉N₇O₆.

STORAGE

Store protected from light.

IMPURITIES

A. imidazole,

B. R = H: (RS)-(2-fluorophenyl)(4-fluorophenyl)phenylmethanol,

C. R = CH₃: (RS)-(2-fluorophenyl)(4-fluorophenyl)methoxyphenylmethane.

FOLIC ACID

Acidum folicum

C₁₉H₁₉N₇O₆

M_r 441.4

DEFINITION

(2S)-2-[[4-[[[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellowish or orange, crystalline powder.

Solubility: practically insoluble in water and in most organic solvents. It dissolves in dilute acids and in alkaline solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Specific optical rotation (2.2.7): + 18 to + 22 (anhydrous substance).

Dissolve 0.25 g in 0.1 M *sodium hydroxide* and dilute to 25.0 ml with the same solvent.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 2 volumes of *concentrated ammonia* R and 9 volumes of *methanol* R and dilute to 100 ml with the same mixture of solvents.

Reference solution. Dissolve 50 mg of *folic acid CRS* in a mixture of 2 volumes of *concentrated ammonia* R and 9 volumes of *methanol* R and dilute to 100 ml with the same mixture of solvents.

Plate: TLC silica gel G plate R.

Mobile phase: *concentrated ammonia* R, *propanol* R, *alcohol* R (20:20:60 V/V/V).

Application: 2 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: ultraviolet light at 365 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in 5 ml of a 28.6 g/l solution of *sodium carbonate* R and dilute to 100.0 ml with the mobile phase.

Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.100 g of *folic acid CRS* in 5 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *pteroic acid R* in 5 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Mix 1.0 ml of this solution with 1.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *N*-(4-aminobenzoyl)-L-glutamic acid *R* in 1 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (e). Dissolve 12.0 mg of *pteroic acid R* in 1 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** spherical *octylsilyl silica gel for chromatography R* (5 μ m) with a carbon loading of 12.5 per cent, a specific surface of 350 m²/g and a pore size of 10 nm.

Mobile phase: mix 12 volumes of *methanol R* and 88 volumes of a solution containing 11.16 g/l *potassium dihydrogen phosphate R* and 5.50 g/l of *dipotassium hydrogen phosphate R* solution.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 5 μ l; inject the test solution and reference solutions (b), (c) (d) and (e).

Run time: 3 times the retention time of folic acid.

Relative retention with reference to folic acid (retention time = about 8.5 min): impurity A = about 0.5; impurity B = about 0.6; impurity C = about 0.9; impurity E = about 1.27; impurity D = about 1.33; impurity F = about 2.2.

System suitability: reference solution (b):

- **resolution:** minimum 4.0 between the peaks due to folic acid and to impurity D.

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent),
- **impurity D:** not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.6 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **total of other impurities:** not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Water (2.5.12): 5.0 per cent to 8.5 per cent, determined on 0.150 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. (2S)-2-[(4-aminobenzoyl)amino]pentanedioic acid (*N*-(4-aminobenzoyl)-L-glutamic acid),

B. 2,5,6-triaminopyrimidin-4(1H)-one,

C. (2S)-2-[[4-[(2-amino-4-oxo-1,4-dihydropteridin-7-yl)methyl]amino]benzoyl]amino]pentanedioic acid (isofolic acid),

D. 4-[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoic acid (pteroic acid),

E. (2S)-2-[[4-bis[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid (6-pterinylfolic acid),

F. 2-amino-7-(chloromethyl)pteridin-4(1*H*)-one.

01/2005:0826

FORMALDEHYDE SOLUTION (35 PER CENT)

Formaldehydi solutio (35 per centum)

DEFINITION

Formaldehyde solution (35 per cent) contains not less than 34.5 per cent *m/m* and not more than 38.0 per cent *m/m* of formaldehyde (CH_2O ; M_r 30.03) with methanol as stabiliser.

CHARACTERS

A clear, colourless liquid, miscible with water and with alcohol. It may be cloudy after storage.

IDENTIFICATION

- Dilute 1 ml of solution S (see Tests) to 10 ml with *water R*. To 0.05 ml of the solution add 1 ml of a 15 g/l solution of *chromotropic acid, sodium salt R*, 2 ml of *water R* and 8 ml of *sulphuric acid R*. A violet-blue or violet-red colour develops within 5 min.
- To 0.1 ml of solution S add 10 ml of *water R*. Add 2 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R*, prepared immediately before use, 1 ml of *potassium ferricyanide solution R* and 5 ml of *hydrochloric acid R*. An intense red colour is formed.
- Mix 0.5 ml with 2 ml of *water R* and 2 ml of *silver nitrate solution R2* in a test-tube. Add *dilute ammonia R2* until slightly alkaline. Heat on a water-bath. A grey precipitate or a silver mirror is formed.
- It complies with the limits of the assay.

TESTS

Solution S. Dilute 10 ml, filtered if necessary, to 50 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 1 ml of *phenolphthalein solution R*. Not more than 0.4 ml of 0.1 *M* sodium hydroxide is required to change the colour of the indicator to red.

Methanol: 9.0 per cent *V/V* to 15.0 per cent *V/V*, determined by gas chromatography (2.2.28), using *ethanol R1* as the internal standard.

Internal standard solution. Dilute 10 ml of *ethanol R1* to 100 ml with *water R*.

Test solution. To 10.0 ml of the solution to be examined add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Reference solution. To 1.0 ml of *methanol R* add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m to 2.0 m long and 2 mm to 4 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (150 μm to 180 μm),

- nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min to 40 ml/min,
 - a flame-ionisation detector,
- maintaining the temperature of the column at 120 °C and that of the injection port and of the detector at 150 °C.

Inject 1 μl of the reference solution. Adjust the sensitivity of the detector so that the heights of the peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to methanol and ethanol is at least 2.0. Inject separately 1 μl of the test solution and 1 μl of the reference solution. Calculate the percentage content of methanol.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Into a 100 ml volumetric flask containing 2.5 ml of *water R* and 1 ml of *dilute sodium hydroxide solution R*, introduce 1.000 g of the solution to be examined, shake and dilute to 100.0 ml with *water R*. To 10.0 ml of the solution add 30.0 ml of 0.05 *M* iodine. Mix and add 10 ml of *dilute sodium hydroxide solution R*. After 15 min, add 25 ml of *dilute sulphuric acid R* and 2 ml of *starch solution R*. Titrate with 0.1 *M* sodium thiosulphate.

1 ml of 0.05 *M* iodine is equivalent to 1.501 mg of CH_2O .

STORAGE

Store protected from light, at a temperature of 15 °C to 25 °C.

01/2005:1724

FORMOTEROL FUMARATE DIHYDRATE

Formoteroli fumaras dihydricus

 $\text{C}_{42}\text{H}_{52}\text{N}_4\text{O}_{12} \cdot 2\text{H}_2\text{O}$ M_r 841

DEFINITION

N-[2-Hydroxy-5-[(1*RS*)-1-hydroxy-2-[(1*RS*)-2-(4-methoxyphenyl)-1-methylethylamino]ethyl]phenyl]formamide (*E*)-butenedioate dihydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white or slightly yellow powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in 2-propanol, practically insoluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: formoterol fumarate dihydrate CRS.

TESTS

pH (2.2.3): 5.5 to 6.5.

Dissolve 20 mg in *carbon dioxide-free water R* while heating to about 40 °C, allow to cool and dilute to 20 ml with the same solvent.

Optical rotation (2.2.7): -0.10° to $+0.10^{\circ}$.

Dissolve 0.25 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Solution A. Dissolve 6.10 g of *sodium dihydrogen phosphate monohydrate R* and 1.03 g of *disodium hydrogen phosphate dihydrate R* in *water R* and dilute to 1000 ml with the same solvent. The pH is 6.0 ± 0.1 .

Solvent mixture: *acetonitrile R*, solution A (16:84 V/V).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture. *Inject within 4 h of preparation, or within 24 h if stored protected from light at 4 °C.*

Reference solution (a). Dissolve 5 mg of *formoterol fumarate for system suitability CRS* (containing impurities A, B, C, D, E, F, G) in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 25.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Column:

- **size:** $l = 0.15$ m, $\emptyset = 4.6$ mm,
- **stationary phase:** spherical *octylsilyl silica gel for chromatography R3* (5 μ m) with a pore size of 8 nm.

Mobile phase:

- **mobile phase A:** *acetonitrile R1*;
- **mobile phase B:** dissolve 3.73 g of *sodium dihydrogen phosphate monohydrate R* and 0.35 g of *phosphoric acid R* in *water R* and dilute to 1000 ml with the same solvent; the pH is 3.1 ± 0.1 ;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	16	84
10 - 37	16 $\rightarrow$ 70	84 $\rightarrow$ 30
37 - 40	70 $\rightarrow$ 16	30 $\rightarrow$ 84
40 - 55	16	84

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 μ l, inject the solvent mixture until a repeatable profile is obtained.

Identification of impurities: use the chromatogram obtained with reference solution (a) and the chromatogram supplied with *formoterol for system suitability CRS* to identify the peaks.

Relative retention with reference to formoterol (retention time = about 12 min): impurity G = about 0.4; impurity A = about 0.5; impurity B = about 0.7; impurity C = about 1.2; impurity D = about 1.3; impurity E = about 1.8; impurity F = about 2.0; impurity H = about 2.2.

System suitability: reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to impurity G and impurity A.

- **peak-to-valley ratio:** minimum 2.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity A by 1.75,
- **impurity A:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **impurities B, C, D, F:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **impurity E:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity I. Liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Sonicate if necessary.

Reference solution (a). Dissolve 5.0 mg of *formoterol for impurity I identification CRS* in *water R* and dilute to 50.0 ml with the same solvent. Sonicate if necessary.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Column:

- **size:** $l = 0.15$ m, $\emptyset = 4.6$ mm,
- **stationary phase:** *octadecyl vinyl polymer for chromatography R*.

Mobile phase: mix 12 volumes of *acetonitrile R1* with 88 volumes of a 5.3 g/l solution of *tripotassium phosphate trihydrate R* previously adjusted to pH 12.0 ± 0.1 with a 280 g/l solution of *potassium hydroxide R* or *phosphoric acid R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 20 μ l.

Elution order: formoterol, impurity I.

System suitability: reference solution (a):

- **peak-to-valley ratio:** minimum 3.5, where H_p = height above the baseline of the peak due to impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

Limit:

- **impurity I:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

Water (2.5.12): 4.0 per cent to 5.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 40.24 mg of $C_{42}H_{52}N_4O_{12}$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, I.

Other detectable impurities: G, H.

A. $R_1 = R_2 = R_4 = H, R_3 = CH_3$: 1-(3-amino-4-hydroxyphenyl)-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethanol,

B. $R_1 = CHO, R_2 = R_3 = R_4 = H$: *N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[[2-(4-methoxyphenyl)ethyl]amino]ethyl]phenyl]formamide,

C. $R_1 = CO-CH_3, R_2 = R_4 = H, R_3 = CH_3$: *N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]acetamide,

D. $R_1 = CHO, R_2 = R_3 = CH_3, R_4 = H$: *N*-[2-hydroxy-5-[1-hydroxy-2-[methyl[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,

E. $R_1 = CHO, R_2 = H, R_3 = R_4 = CH_3$: *N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxy-3-methylphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,

F. *N*-[2-hydroxy-5-[1-[[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]amino]-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,

G. (2*RS*)-1-(4-methoxyphenyl)propan-2-amine,

H. *N*-[5-[(1*RS*)-2-[benzyl[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]-1-hydroxyethyl]-2-hydroxyphenyl]formamide (monobenzyl analogue),

I. *N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[(1*SR*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide (diastereoisomer).

FOSCARNET SODIUM HEXAHYDRATE

Foscarnetum natricum hexahydricum

$CNa_3O_5P, 6H_2O$

M_r 300.0

DEFINITION

Foscarnet sodium hexahydrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of trisodium phosphonatoformate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *foscarnet sodium hexahydrate CRS*.
B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension I (2.2.1) and is colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 9.0 to 11.0.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of foscarnet impurity B CRS in the mobile phase, add 2.0 ml of the test solution and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.0 ml/min a solution prepared as follows: dissolve 3.22 g of *sodium sulphate decahydrate R* in *water R*, add 3 ml of *glacial acetic acid R*, 6 ml of a 44.61 g/l solution of *sodium pyrophosphate R* and dilute to 1000 ml with *water R* (solution A); dissolve 3.22 g of *sodium sulphate decahydrate R* in *water R*, add 6.8 g of *sodium acetate R* and 6 ml of a 44.61 g/l solution of *sodium pyrophosphate R* and dilute to 1000 ml with *water R* (solution B). Mix about 700 ml of solution A and about 300 ml of solution B to obtain a solution of pH 4.4. To 1000 ml of this solution, add 0.25 g of *tetrahexylammonium hydrogen sulphate R* and 100 ml of *methanol R*.
- as detector a spectrophotometer set at 230 nm.

Inject 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of foscarnet. The test is not valid unless the resolution between the peaks due to foscarnet and impurity B is at least 7.

Inject 20 µl of the test solution and 20 µl of reference solution (a). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Disregard any peak with a relative retention time less than 0.6 and any peak with an area less than 0.2 times that of the peak in the chromatogram obtained with reference solution (a).

Impurity D. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.25 g of the substance to be examined in 9.0 ml of 0.1 M *acetic acid* using a magnetic stirrer. Add 1.0 ml of *ethanol R* and mix.

Reference solution. Dissolve 25 mg of *triethyl phosphonoformate R* in *ethanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *ethanol R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.31 mm in internal diameter coated with *poly(dimethyl)(diphenyl)(divinyl)siloxane R* (film thickness 0.5 µm),
- *helium for chromatography R* as the carrier gas,
- a flame-ionisation detector,
- a split mode injector of 1:20,

raising the temperature of the column from 100 °C to 180 °C at a rate of 10 °C per minute and maintaining the temperature of the injection port at 200 °C and that of the detector at 250 °C.

Inject 3 µl of each solution.

In the chromatogram obtained with the test solution the area of any peak due to impurity D is not greater than the area of the peak in the chromatogram obtained with reference solution (0.1 per cent).

Phosphate and phosphite. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 28 mg of *sodium dihydrogen phosphate monohydrate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 43 mg of *sodium phosphite pentahydrate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 25 ml with *water R*.

Reference solution (d). Dilute 3 ml of reference solution (a) and 3 ml of reference solution (b) to 25 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.05 m long and 4.6 mm in internal diameter packed with an *anion exchange resin R*,
- as mobile phase at a flow rate of 1.4 ml/min a solution prepared as follows: dissolve 0.102 g of *potassium hydrogen phthalate R* in *water R*, add 2.5 ml of 1 M *nitric acid* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 290 nm (indirect detection).

Inject 20 µl of reference solution (d). The test is not valid unless: the resolution between the peaks due to phosphate (first peak) and phosphite is at least 2.0; the principal peak has a signal-to-noise ratio of at least ten.

Inject 20 µl of the test solution and 20 µl of reference solution (c). In the chromatogram obtained with the test solution: the area of any peak due to phosphate and phosphite is not greater than the area of the corresponding peaks in the chromatogram obtained with reference solution (c) (0.3 per cent of phosphate and 0.3 per cent of phosphite).

Heavy metals. Dissolve 1.25 g in 12.5 ml of 1 M *hydrochloric acid*. Warm on a water-bath for 3 min and cool to room temperature. Transfer to a beaker and adjust the pH to about 3.5 with *dilute ammonia R1* and dilute to 25 ml with *water R* (solution A). To 12 ml of solution A, add 2.0 ml of *buffer solution pH 3.5 R*. Rapidly pour the mixture into a test tube containing one drop of *sodium sulphide solution R*. The solution is not more intensely coloured than a standard prepared simultaneously and in the same manner pouring a mixture of 5.0 ml of *lead standard solution (1 ppm Pb) R*, 5.0 ml of *water R*, 2.0 ml of solution A and 2.0 ml of *buffer solution pH 3.5 R* into a test tube containing one drop of *sodium sulphide solution R* (10 ppm).

Loss on drying (2.2.32): 35.0 per cent to 37.0 per cent, determined on 1.000 g by drying in an oven at 150 °C.

Bacterial endotoxins (2.6.14): less than 83.3 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.200 g in 50 ml of *water R*. Titrate with 0.05 M *sulphuric acid*, determining the end-point potentiometrically (2.2.20) at the first inflexion point.

1 ml of 0.05 M *sulphuric acid* is equivalent to 19.20 mg of CNa₃O₅P.

STORAGE

Store protected from light.

IMPURITIES

- A. R1 = OC₂H₅, R2 = R3 = ONa: disodium (ethoxycarbonyl)phosphonate,
- B. R1 = R2 = ONa, R3 = OC₂H₅: disodium (ethoxyoxydophosphanyl)formate,
- C. R1 = R2 = OC₂H₅, R3 = ONa: ethyl sodium (ethoxycarbonyl)phosphonate,
- D. R1 = R2 = R3 = OC₂H₅: methyl (diethoxyphosphoryl)formate.

01/2005:1328

FOSFOMYCIN CALCIUM

Fosfomycinum calcium

C₃H₅CaO₄P·H₂OM_r 194.1

DEFINITION

Calcium fosfomycin contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of calcium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, practically insoluble in acetone, in methanol and in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of fosfomycin calcium*. Examine the substance as discs prepared using *potassium bromide R*.
- B. Dissolve about 0.1 g in 3 ml of a 25 per cent V/V solution of *perchloric acid R*. Add 1 ml of 0.1 M *sodium periodate* and heat on a water-bath for 30 min. Allow to cool and add 50 ml of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 ml of a freshly prepared 400 g/l solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.
- C. To about 8 mg of the substance to be examined, add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of 0.1 M *sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

D. It gives reaction (a) of calcium (2.3.1).

TESTS

pH (2.2.3). Dissolve 20 mg in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent. The pH of the solution is 8.1 to 9.6.

Specific optical rotation (2.2.7). Dissolve 2.5 g in a 125 g/l solution of *sodium edetate R* previously adjusted to pH 8.5 with *strong sodium hydroxide solution R*, and dilute to 50.0 ml with the same solution. Measured at 405 nm using a mercury lamp, the specific optical rotation is –11.0 to –13.0, calculated with reference to the anhydrous substance.

Calcium 1,2-(dihydroxypropyl)phosphonate. Not more than 1.5 per cent. Into a glass-stoppered flask, dissolve 0.200 g of the substance to be examined in 100.0 ml of *water R*. Add 50 ml of 0.5 M *phthalate buffer solution pH 6.4 R* and 5.0 ml of 0.005 M *sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and shake for 2 min. Titrate with 0.0025 M *sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and titrate slowly until the colour is completely discharged. Carry out a blank test under the same conditions. Calculate the percentage content of C₃H₇CaO₅P from the expression:

$$\frac{(n_1 - n_2) \times c \times 97}{m(100 - H)} \times 100$$

- m* = quantity of the substance to be examined, in milligrams,
- n*₁ = volume of 0.0025 M *sodium arsenite* used in the blank titration,
- n*₂ = volume of 0.0025 M *sodium arsenite* used in the titration of the test solution,
- c* = molarity of the sodium arsenite solution,
- H* = percentage content of water.

Chlorides (2.4.4). Dissolve 0.500 g in *water R*, add 2 ml of *nitric acid R* and dilute to 50 ml with the same acid. To 2.5 ml of the solution add 12.5 ml of *water R*. The solution complies with the limit test for chlorides (0.2 per cent).

Heavy metals (2.4.8). Dissolve 2.5 g of the substance to be examined in 6 ml of *glacial acetic acid R* and dilute to 25.0 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12): 8.5 per cent to 11.5 per cent, determined on 0.250 g by the semi-micro determination of water. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

ASSAY

Into a glass-stoppered flask, dissolve 0.120 g of the substance to be examined in 20.0 ml of 0.1 M *sodium periodate*. Add 5 ml of a 50 per cent V/V solution of *perchloric acid R* and shake. Heat in a water-bath at 37 °C for 105 min. Add 50 ml of *water R* and immediately adjust to pH 6.4 with a saturated solution of *sodium hydrogen carbonate R*. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with 0.1 M *sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and titrate slowly until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5CaO_4P$ from the expression:

$$\frac{(n_1 - n_2) \times c \times 88 \times 100}{m(100 - H)} \times 100 - G$$

- m = quantity of the substance to be examined, in milligrams,
 n_1 = volume of 0.1 M sodium arsenite used in the blank titration,
 n_2 = volume of 0.1 M sodium arsenite used in the titration of the test solution,
 c = molarity of the sodium arsenite solution,
 G = percentage content of calcium 1,2-(dihydroxypropyl)phosphonate,
 H = percentage content of water.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. calcium (1,2-dihydroxypropyl)phosphonate.

01/2005:1329

FOSFOMYCIN SODIUM

Fosfomycinum natricum

$C_3H_5Na_2O_4P$

M_r 182.0

DEFINITION

Fosfomycin sodium contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of disodium (2R,3S)-(3-methyloxiran-2-yl)phosphonate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, very hygroscopic powder, very soluble in water, sparingly soluble in methanol, practically insoluble in ethanol and in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of fosfomycin sodium*. Examine the substance as discs prepared using *potassium bromide R*.
 B. Dissolve about 0.1 g in 3 ml of a 25 per cent V/V solution of *perchloric acid R*. Add 1 ml of 0.1 M sodium periodate and heat on a water-bath for 30 min. Allow to cool and add 50 ml of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 ml of a freshly prepared 400 g/l solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.

- C. To about 8 mg of the substance to be examined, add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of 0.1 M sodium periodate. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

- D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₉ (2.2.2, *Method II*).

pH (2.2.3). Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*. The pH of the solution is 9.0 to 10.5.

Specific optical rotation (2.2.7). Dissolve 2.5 g in *water R* and dilute to 50.0 ml with the same solvent. Measured at 405 nm using a mercury lamp, the specific optical rotation is –13.0 to –15.0, calculated with reference to the anhydrous substance.

Disodium 1,2-(dihydroxypropyl)phosphonate. Not more than 1.0 per cent. Into a glass-stoppered flask, dissolve 0.200 g of the substance to be examined in 100.0 ml of *water R*. Add 50 ml of 0.5 M *phthalate buffer solution pH 6.4 R* and 5.0 ml of 0.005 M *sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and shake for 2 min. Titrate with 0.0025 M *sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and titrate slowly until the colour is completely discharged. Carry out a blank test under the same conditions. Calculate the percentage content of $C_3H_7Na_2O_5P$ from the expression:

$$\frac{(n_1 - n_2) \times c \times 100}{m(100 - H)} \times 100$$

- m = quantity of the substance to be examined, in milligrams,
 n_1 = volume of 0.0025 M sodium arsenite used in the blank titration,
 n_2 = volume of 0.0025 M sodium arsenite used in the titration of the test solution,
 c = molarity of the sodium arsenite solution,
 H = percentage content of water.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 0.50 g by the semi-micro determination of water. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

Bacterial endotoxins (2.6.14): less than 0.083 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Into a glass-stoppered flask, dissolve 0.120 g of the substance to be examined in 20.0 ml of 0.1 M *sodium periodate*. Add 5 ml of a 50 per cent V/V solution of *perchloric acid R* and shake. Heat on a water-bath at 37 °C for 105 min. Add 50 ml of *water R* and immediately adjust to pH 6.4 with a saturated

solution of *sodium hydrogen carbonate R*. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with 0.1 M *sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and titrate slowly until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5Na_2O_4P$ from the expression:

$$\frac{(n_1 - n_2) \times c \times 91 \times 100}{m(100 - H)} \times 100 - G$$

- m = quantity of the substance to be examined, in milligrams,
 n_1 = volume of 0.1 M *sodium arsenite* used in the blank titration,
 n_2 = volume of 0.1 M *sodium arsenite* used in the titration of the test solution,
 c = molarity of the sodium arsenite solution,
 G = percentage content of disodium 1,2-(dihydroxypropyl)phosphonate,
 H = percentage content of water.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. disodium (1,2-dihydroxypropyl)phosphonate.

01/2005:1425

FOSFOMYCIN TROMETAMOL

Fosfomycinum trometamol

$C_7H_{18}NO_7P$

M_r 259.2

DEFINITION

Fosfomycin trometamol contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 1,3-dihydroxy-2-(hydroxymethyl)propan-2-aminium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, slightly soluble in alcohol and in methanol, practically insoluble in acetone.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *fosfomycin trometamol CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R* as the coating substance.
Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.
Reference solution. Dissolve 50 mg of *fosfomycin trometamol CRS* in *water R* and dilute to 10 ml with the same solvent.
 Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 20 volumes of *water R* and 70 volumes of *2-propanol R*. Dry the plate in a current of warm air and expose it to iodine vapour until the spots appear. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.
- C. To about 15 mg of the substance to be examined, add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of 0.1 M *sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

pH (2.2.3). The pH of solution S is 3.5 to 5.5.

Specific optical rotation (2.2.7). Measured at 365 nm using a mercury lamp, the specific optical rotation is -13.5 to -12.5 , determined on solution S and calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay.

Inject 5 µl of the test solution, 5 µl of reference solution (b) and 5 µl of the blank solution. Continue the chromatography for twice the retention time of the peak due to fosfomycin. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent, calculated as trometamol salts); the area of any peak, apart from the principal peak, two peaks corresponding to trometamol and any peak corresponding to impurity A, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent, calculated as trometamol salts). The sum of the areas of all the peaks, apart from the principal peak and the two peaks corresponding to trometamol, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent, calculated as trometamol salts). Disregard any peak due to the blank and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Phosphates. Dissolve 0.1 g in 3 ml of *dilute nitric acid R* and dilute to 10 ml with *water R*. To 5 ml of this test solution add 5 ml of *water R* and 5 ml of *molybdovanadic reagent R*. Shake vigorously. After 5 min, any colour in the test solution

is not more intense than that in a standard prepared at the same time in the same manner, using 5 ml of *phosphate standard solution* (5 ppm PO_4) R (500 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water* R and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Water (2.5.12). Not more than 0.5 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Examine the substance by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.60 g of the substance to be examined in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.60 g of *fosfomycin trometamol CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dissolve 8.7 mg of *fosfomycin trometamol impurity A CRS* (disodium salt) in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *fosfomycin trometamol impurity A CRS* (disodium salt) and 10 mg of *fosfomycin trometamol CRS* in the mobile phase and dilute to 5 ml with the mobile phase.

Blank solution. A 0.3 g/l solution of *anhydrous disodium hydrogen phosphate* R in the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *aminopropylsilyl silica gel for chromatography* R (5 μm),
- as mobile phase at a flow rate of 1 ml/min a 10.89 g/l solution of *potassium dihydrogen phosphate* R,
- as detector a differential refractometer maintaining the temperature at 35 °C.

When the chromatograms are recorded in the prescribed conditions, the relative retention times (to fosfomycin) are about 0.3 for the two peaks corresponding to trometamol and 0.8 for impurity A.

Inject 5 μl of reference solution (c). The test is not valid unless the resolution between the peaks corresponding to fosfomycin and impurity A is at least 1.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for fosfomycin is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

Calculate the percentage content of fosfomycin trometamol.

STORAGE

Store in an airtight container.

IMPURITIES

- A. 1,3-dihydroxy-2-(hydroxymethyl)propan-2-aminium (1,2-dihydroxypropyl)phosphonate,

- B. [2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]phosphonic acid,

- C. 2-amino-3-hydroxy-2-(hydroxymethyl)propyl dihydrogenphosphate (trometamol phosphoric ester),

- D. [2-[[[2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]hydroxyphosphoryl]oxy]-1-hydroxypropyl]phosphonic acid (trometamoyloxy fosfomycin dimer).

FRAMYCETIN SULPHATE

Framycetini sulfas

$\text{C}_{23}\text{H}_{46}\text{N}_6\text{O}_{13} \cdot x\text{H}_2\text{SO}_4$

M_r 615 (base)

DEFINITION

Sulphate of 2-deoxy-4-O-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-5-O-[3-O-(2,6-diamino-2,6-dideoxy- β -L-idopyranosyl)- β -D-ribofuranosyl]-D-streptamine (neomycin B), a substance produced by the growth of selected strains of *Streptomyces fradiae* or *Streptomyces decaris* or obtained by any other means.

Content: minimum of 630 IU/mg (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: freely soluble in water, very slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

- A. Examine the chromatograms obtained in the test for related substances.

Results:

- the retention time of the principal peak in the chromatogram obtained with the test solution is approximately the same as that of the principal peak in the chromatogram obtained with reference solution (a),
- it complies with the limit given for impurity C.

B. It gives reaction (a) of sulphates (2.3.1).

TESTS

pH (2.2.3): 6.0 to 7.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): + 52.5 to + 55.5 (dried substance).

Dissolve 1.00 g in *water R* and dilute to 10.0 ml with the same solvent

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *framycetin sulphate CRS* in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.5 mg/ml.

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve the contents of a vial of *neamine CRS* (corresponding to 0.5 mg) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *neomycin sulphate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography *R* (5 μ m),
- **temperature:** 25 °C.

Mobile phase: mix 20.0 ml of *trifluoroacetic acid R*, 6.0 ml of *carbonate-free sodium hydroxide solution R* and 500 ml of *water R*, allow to equilibrate, dilute to 1000 ml with *water R* and degas.

Flow rate: 0.7 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted 1 in 25 previously degassed, which is added pulse-less to the column effluent using a 375 μ l polymeric mixing coil.

Flow rate: 0.5 ml/min.

Detection: pulsed amperometric detector with a gold working electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively 0.00 V detection, + 0.80 V oxidation and – 0.60 V reduction potentials, with pulse durations according to the instrument used.

Injection: 10 μ l.

Run time: 1.5 times the retention time of neomycin B.

Relative retention with reference to neomycin B (retention time = about 10 min): impurity A = about 0.65; impurity C = about 0.9; impurity G = about 1.1.

System suitability:

- **resolution:** minimum 2.0 between the peaks due to impurity C and to neomycin B in the chromatogram obtained with reference solution (e); if necessary, adjust the volume of the carbonate-free sodium hydroxide solution in the mobile phase,
- **signal-to-noise ratio:** minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) and taking into account the declared content of *neamine CRS* (1.0 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- **total of other impurities:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Sulphate: 27.0 per cent to 31.0 per cent (dried substance).

Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of SO_4 .

Loss on drying (2.2.32): maximum 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

Sterility (2.6.1). If intended for introduction into body cavities without a further appropriate sterilisation procedure, it complies with the test for sterility.

Bacterial endotoxins (2.6.14, *Method D*): less than 1.3 IU/mg if intended for introduction into body cavities without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *framycetin sulphate CRS* as the reference substance.

STORAGE

In an airtight container, protected from light. If the substance is intended for introduction into body cavities, store in a sterile, tamper-proof container.

LABELLING

The label states:

- where applicable, that the substance is sterile,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R1 = H, R2 = NH₂: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-D-streptamine (neamine or neomycin A-LP),
- B. R1 = CO-CH₃, R2 = NH₂: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-D-streptamine (3-acetylneamine),
- D. R1 = H, R2 = OH: 4-*O*-(2-amino-2-deoxy- α -D-glucopyranosyl)-2-deoxy-D-streptamine (paromamine or neomycin D),

- C. R1 = CH₂-NH₂, R2 = R3 = H, R4 = NH₂: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)- β -D-ribofuranosyl]-D-streptamine (neomycin C),
- E. R1 = R3 = H, R2 = CH₂-NH₂, R4 = OH: 4-*O*-(2-amino-2-deoxy- α -D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy- β -L-idopyranosyl)- β -D-ribofuranosyl]-D-streptamine (paromomycin I or neomycin E),
- F. R1 = CH₂-NH₂, R2 = R3 = H, R4 = OH: 4-*O*-(2-amino-2-deoxy- α -D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)- β -D-ribofuranosyl]-D-streptamine (paromomycin II or neomycin F),
- G. R1 = H, R2 = CH₂-NH₂, R3 = CO-CH₃, R4 = NH₂: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy- β -L-idopyranosyl)- β -D-ribofuranosyl]-D-streptamine (neomycin B-LP).

01/2005:0025

FRANGULA BARK

Frangulae cortex

DEFINITION

Frangula bark consists of the dried, whole or fragmented bark of the stems and branches of *Rhamnus frangula* L. (*Frangula alnus* Miller). It contains not less than 7.0 per cent of glucofrangulins, expressed as glucofrangulin A (C₂₇H₃₀O₁₄; M_r 578.5) and calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under Identification tests A and B.

IDENTIFICATION

- A. The bark occurs in curved, almost flat or rolled fragments or in single or double quilled pieces usually 0.5 mm to 2 mm thick and variable in length and width. The greyish-brown or dark brown outer surface is wrinkled longitudinally and covered with numerous greyish, transversely elongated lenticels; when the outer layers are removed, a dark red layer is exposed. The orange-brown to reddish-brown inner surface is smooth and bears fine longitudinal striations; it becomes red when treated with alkali. The fracture is short, fibrous in the inner part.
- B. Reduce to a powder (355). The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powdered drug shows: numerous phloem fibres, partially lignified, in groups with crystal sheaths containing calcium oxalate prisms; reddish-brown fragments of cork; fragments of parenchyma containing calcium oxalate cluster crystals. Sclereids are absent.
- C. Examine the chromatogram obtained in the test for "Other species of *Rhamnus*; anthrones" in daylight. The chromatogram obtained with the test solution shows two orange brown zones (glucofrangulins) in the lower third and two to four red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.
- D. To about 50 mg of the powdered drug (180) add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Other species of *Rhamnus*; anthrones. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.5 g of the powdered drug (180) add 5 ml of *alcohol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution. Dissolve 20 mg of *barbaloin R* in *alcohol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Apply separately to the plate, as bands, 10 μ l of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry for 5 min, spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R*, and heat at 100-105 °C for 15 min. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows a brownish-yellow zone corresponding to barbaloin in the central part. The chromatogram obtained with the test solution shows no zones of intense yellow fluorescence and no zone of orange to reddish fluorescence similar in position to the zone of barbaloin in the chromatogram obtained with the reference solution.

Apply to another plate, as a band, 10 μ l of the test solution and develop as described above. Allow the plate to dry for not longer than 5 min and spray immediately with a 5 g/l solution of *nitrotetrazolium blue R* in *methanol R*. Examine the chromatogram immediately. No violet or greyish-blue zones appear.

Foreign matter (2.8.2). Not more than 1 per cent.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 6.0 per cent.

ASSAY

Carry out the assay protected from bright light.

In a tared, round-bottomed flask with a ground-glass neck, weigh 0.250 g of powdered drug (180). Add 25.0 ml of a 70 per cent V/V solution of *methanol R*; mix and weigh again. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent V/V solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with five quantities, each of 20 ml, of *light petroleum R*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with two quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid. Calculate the percentage of glucofrangulins, expressed as glucofrangulin A, from the expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204.

A = absorbance at 515 nm,

m = mass of the sample, in grams.

STORAGE

Store protected from light.

01/2005:1214

FRANGULA BARK DRY EXTRACT, STANDARDISED

Frangulae corticis extractum siccum normatum

DEFINITION

Standardised frangula bark dry extract is produced from *Frangula bark* (0025). It contains not less than 15.0 per cent and not more than 30.0 per cent of glucofrangulins, expressed as glucofrangulin A ($C_{27}H_{30}O_{14}$; M_r 578.5) and

calculated with reference to the dried extract. The measured content does not deviate from that stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the drug and ethanol (50 to 80 per cent V/V) by an appropriate procedure.

CHARACTERS

A yellowish-brown, fine powder.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.05 g add 5 ml of *alcohol* (70 per cent V/V) *R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution. Dissolve 20 mg of *barbaloin R* in *alcohol* (70 per cent V/V) *R* and dilute to 10 ml with the same solvent.

Apply separately to the plate, as bands, 10 μ l of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry for 5 min, then spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol* (50 per cent V/V) *R* and heat at 100-105 °C for 15 min. Examine immediately after heating. The chromatogram obtained with the reference solution shows a reddish-brown zone in the median third corresponding to barbaloin. The chromatogram obtained with the test solution shows two orange-brown zones (glucofrangulins) in the lower third and two to four red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

B. To about 25 mg add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Loss on drying (2.8.17): maximum 5.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 per gram of which not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

Carry out the assay protected from bright light.

In a tared round-bottomed flask with a ground-glass neck, weigh 0.100 g of the preparation to be examined. Add 25.0 ml of a 70 per cent V/V solution of *methanol R*, mix and weigh again. Heat the flask in a water-bath under a reflux condenser at 70 °C for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent V/V solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with five quantities, each of 20 ml, of *light petroleum R1*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with two quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a

ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage of glucofrangulins, expressed as glucofrangulin A from the expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204, calculated on the basis of the specific absorbance of barbaloin,

A = absorbance at 515 nm,

m = mass of the preparation to be examined, in grams.

STORAGE

Store in an airtight container, protected from light.

LABELLING

The label states the content of glucofrangulins.

01/2005:0188

FRUCTOSE

Fructosum

$C_6H_{12}O_6$

M_r 180.2

DEFINITION

Fructose is (-)-D-arabino-hex-2-ulopyranose. The substance described in this monograph is not necessarily suitable for parenteral use.

CHARACTERS

A white, crystalline powder, with a very sweet taste, very soluble in water, soluble in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *fructose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg each of *fructose CRS*, *glucose CRS*, *lactose CRS* and *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply separately to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The solvents should be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows four clearly separated spots.

- B. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.
- C. To 1 ml of solution S (see Tests) add 9 ml of *water R*. To 1 ml of the solution add 5 ml of *hydrochloric acid R* and heat to 70 °C. A brown colour develops.
- D. Dissolve 5 g in *water R* and dilute to 10 ml with the same solvent. To 0.5 ml of the solution add 0.2 g of *resorcinol R* and 9 ml of *dilute hydrochloric acid R* and heat on a water-bath for 2 min. A red colour develops.

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Dissolve 5.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1). Add 10 ml of *water R*. The solution is colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water R* and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.15 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (2.2.7). Dissolve 10.0 g in 80 ml of *water R*, add 0.2 ml of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 ml with *water R*. The specific optical rotation is -91.0 to -93.5, calculated with reference to the anhydrous substance.

Foreign sugars. Dissolve 5.0 g in *water R* and dilute to 10 ml with the same solvent. To 1 ml of the solution add 9 ml of *alcohol R*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of the initial solution and 9 ml of *water R*.

5-Hydroxymethylfurfural and related compounds. To 5 ml of solution S add 5 ml of *water R*. The absorbance (2.2.25) measured at 284 nm is not greater than 0.32.

Barium. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

Lead in sugars (2.4.10). It complies with the limit test for lead in sugars (0.5 ppm).

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent. Dissolve 5.0 g in 10 ml of *water R*, add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass.

01/2005:0391

FUROSEMIDE

Furosemidum

C₁₂H₁₁ClN₂O₅SM_r 330.7

DEFINITION

Furosemide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-chloro-2-[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone, sparingly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

It melts at about 210 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- Dissolve 50 mg in a 4 g/l solution of *sodium hydroxide R* and dilute to 100 ml with the same alkaline solution. Dilute 1 ml of the solution to 100 ml with a 4 g/l solution of *sodium hydroxide R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows three absorption maxima, at 228 nm, 270 nm and 333 nm. The ratio of the absorbance measured at the maximum at 270 nm to that measured at the maximum at 228 nm is 0.52 to 0.57.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *furosemide CRS*.
- Dissolve about 25 mg in 10 ml of *alcohol R*. To 5 ml add 10 ml of *water R*. To 0.2 ml of this solution add 10 ml of *dilute hydrochloric acid R* and heat under a reflux condenser for 15 min. Allow to cool and add 18 ml of 1 M *sodium hydroxide* and 1 ml of a 5 g/l solution of *sodium nitrite R*. Allow to stand for 3 min, add 2 ml of a 25 g/l solution of *sulphamic acid R* and mix. Add 1 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. A violet-red colour develops.

TESTS

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *furosemide impurity A CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute a mixture of 1.0 ml of the test solution and 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml per minute a mixture prepared as follows: dissolve 0.2 g of *potassium dihydrogen phosphate R* and 0.25 g of *cetrimide R* in 70 ml of *water R*; adjust to pH 7.0 with *ammonia R* and add 30 ml of *propanol R*,
- as detector a spectrophotometer set at 238 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are not less than 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (*furosemide impurity A*) and the second peak (*furosemide*) is at least 4.

Inject 20 µl of the test solution. Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the first peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the first peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.1 times the area of the first peak in the chromatogram obtained with reference solution (b).

Chlorides (2.4.4). To 0.5 g add a mixture of 0.2 ml of *nitric acid R* and 30 ml of *water R* and shake for 5 min. Allow to stand for 15 min and filter. 15 ml of the filtrate complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 1.0 g add a mixture of 0.2 ml of *acetic acid R* and 30 ml of *distilled water R* and shake for 5 min. Allow to stand for 15 min and filter. 15 ml of the filtrate complies with the limit test for sulphates (300 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 20 ml of *dimethylformamide R*. Titrate with 0.1 M *sodium hydroxide* using 0.2 ml of *bromothymol blue solution R2*. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 33.07 mg of C₁₂H₁₁ClN₂O₅S.

STORAGE

Store protected from light.

IMPURITIES

A. 2-chloro-4-[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid,

B. R1 = Cl, R2 = SO₂NH₂: 2,4-dichloro-5-sulphamoylbenzoic acid,

C. R1 = NH₂, R2 = SO₂NH₂: 2-amino-4-chloro-5-sulphamoylbenzoic acid,

E. R1 = Cl, R2 = H: 2,4-dichlorobenzoic acid,

D. 2,4-bis[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid.

01/2005:0798

FUSIDIC ACID

Acidum fusidicum

C₃₁H₄₈O₆ · 1/2 H₂O

M_r 525.7

DEFINITION

Fusidic acid is *ent*-(17*Z*)-16α-(acetyloxy)-3β,11β-dihydroxy-4β,8,14-trimethyl-18-nor-5β,10α-cholesta-17(20),24-dien-21-oic acid, an antimicrobial substance produced by the growth of certain strains of *Fusidium coccineum* or by any other means. It contains not less than 97.5 per cent and not more than the equivalent of 101.0 per cent of C₃₁H₄₈O₆, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with the *Ph. Eur. reference spectrum of fusidic acid*.
- Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 24 mg of *diethanolamine fusidate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2.5 volumes of *methanol R*, 10 volumes of *glacial acetic acid R*, 10 volumes of *cyclohexane R* and 80 volumes of *chloroform R*. Dry the plate in a current of hot air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid CRS* in 5 ml of the mobile phase. To 1.0 ml of this solution add 0.20 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a steel column 0.125 m to 0.15 m long and 4 mm to 5 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 10 volumes of *methanol R*, 20 volumes of a 10 g/l solution of *phosphoric acid R*, 20 volumes of *water R* and 50 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 235 nm,
- a 20 µl loop injector.

Continue the chromatography for at least 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak and the solvent peak, is not greater than twice the area of the peak corresponding to fusidic acid in the chromatogram obtained with reference solution (a) (2.0 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (b). The test is not valid unless: the resolution between the peaks corresponding to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with reference solution (a) is at least 2.5; the principal peak in the chromatogram obtained with reference solution (b) has a signal-to-noise ratio of at least 3.

Water (2.5.12): 1.4 per cent to 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 10 ml of *alcohol R*. Add 0.5 ml of *phenolphthalein solution R*. Titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 51.67 mg of C₃₁H₄₈O₆.

STORAGE

Store protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

A. 2-chloro-4-[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid,

B. R1 = Cl, R2 = SO₂NH₂: 2,4-dichloro-5-sulphamoylbenzoic acid,

Water (2.5.12): 1.4 per cent to 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 10 ml of *alcohol R*. Add 0.5 ml of *phenolphthalein solution R*. Titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 51.67 mg of C₃₁H₄₈O₆.

STORAGE

Store protected from light, at a temperature of 2 °C to 8 °C.

GALACTOSE

Galactosum

 $C_6H_{12}O_6$
 M_r 180.2

DEFINITION

Galactose is D-galactopyranose.

CHARACTERS

A white, crystalline or finely granulated powder, freely soluble or soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *galactose CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *galactose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *galactose CRS*, 10 mg of *glucose CRS* and 10 mg of *lactose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply to the plate 2 µl of each solution and thoroughly dry the starting points. Develop in an unsaturated tank over a path of 15 cm using a mixture of 15 volumes of *water R* and 85 volumes of *propanol R*. Dry the plate in a current of warm air. Spray uniformly with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat in an oven at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. An orange to red precipitate is formed.

TESTS

Solution S. Dissolve, with heating in a water-bath at 50 °C, 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₈ (2.2.2, *Method II*).

01/2005:1215 Acidity or alkalinity. To 30 ml of solution S add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 1.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (2.2.7). Dissolve 10.00 g in 80 ml of *water R* and add 0.2 ml of *dilute ammonia R1*. Allow to stand for 30 min and dilute to 100.0 ml with *water R*. The specific optical rotation is + 78.0 to + 81.5, calculated with reference to the anhydrous substance.

Barium. Dilute 5 ml of solution S to 10 ml with *distilled water R*. Add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 5 ml of solution S and 6 ml of *distilled water R*.

Lead (2.4.10). It complies with the limit test for lead in sugars (0.5 ppm).

Water (2.5.12). Not more than 1.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash. To 5 ml of solution S add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass. The residue weighs not more than 1 mg (0.1 per cent).

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per gram.

01/2005:0181

GALLAMINE TRIETHIODIDE

Gallamini triethiodidum

 $C_{30}H_{60}I_3N_3O_3$
 M_r 892

DEFINITION

Gallamine triethiodide contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 2,2',2''-[benzene-1,2,3-triyltris(oxy)]tris(*N,N,N*-triethylethanaminium) triiodide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 50 mg in 0.01 M *hydrochloric acid* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with 0.01 M *hydrochloric acid*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 225 nm. The specific absorbance at the maximum is 500 to 550.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *gallamine triethiodide CRS*.

- C. To 5 ml of solution S (see Tests) add 1 ml of *potassium tetraiodomercurate solution R*. A yellow precipitate is formed.
- D. Dilute 0.5 ml of solution S to 2 ml with *water R*. Add 0.2 ml of *dilute nitric acid R*. The solution gives reaction (a) of iodides (2.3.1).

TESTS

Solution S. Dissolve 0.6 g in *water R* and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and immediately after preparation is not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Acidity or alkalinity. To 50 ml of *water R* add 0.2 ml of *methyl red solution R*. Add either 0.01 M *sulphuric acid* or 0.02 M *sodium hydroxide* until an orange-yellow colour is obtained. Add 1.0 g of the substance to be examined and dissolve by shaking. Not more than 0.2 ml of 0.01 M *sulphuric acid* or 0.02 M *sodium hydroxide* is required to restore the orange-yellow colour.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a solution prepared as follows: dissolve 14 g of *sodium perchlorate R* in 850 ml of *phosphate buffer pH 3.0 R* and add 150 ml of *methanol R*,
- as detector a spectrophotometer set at 205 nm.

When the chromatograms are recorded in the prescribed conditions, the retention times relative to triethylgallamine as perchlorate (about 40 min) are: impurity A about 0.45, impurity B about 0.50, impurity C about 0.65, impurity D about 0.75, impurity E about 0.85 and impurity F about 0.90.

Inject separately 20 µl of the test solution and 20 µl of the reference solution. Continue the chromatography for 1.5 times the retention time of triethylgallamine as perchlorate.

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent) and the sum of the areas of such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 per cent). Disregard the peak due to iodide with a retention time of zero.

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.270 g in a mixture of 5.0 ml of *anhydrous formic acid R* and 50.0 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.72 mg of C₃₀H₆₀I₃N₃O₃.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. 2,2',2''-[benzene-1,2,3-triyltris(oxy)]tris(*N,N*-diethylethanamine),

- B. 2,2'-[2-[2-(triethylammonio)ethyl]-1,3-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,

- C. 2,2'-[2-[2-(diethylmethylammonio)ethoxy]-1,3-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,

- D. 2,2'-[3-[2-(diethylmethylammonio)ethoxy]-1,2-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,

- E. 2,2'-[3-[2-(diethylamino)ethoxy]-1,2-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) diiodide,

- F. 2,2',2''-[4-[2-(triethylammonio)ethyl]benzene-1,2,3-triyltris(oxy)]tris(*N,N,N*-triethylethanaminium) tetraiodide.

01/2005:1216

GARLIC POWDER

Allii sativi bulbi pulvis

DEFINITION

Garlic powder is produced from the bulbs of *Allium sativum* L., cut, freeze-dried or dried at a temperature not exceeding 65 °C and powdered. It contains not less than 0.45 per cent of allicin (C₆H₁₀OS₂; *M_r* 162.3), calculated with reference to the dried drug.

CHARACTERS

A light yellowish powder.

It shows the microscopic characters described under Identification test A.

IDENTIFICATION

A. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous fragments of parenchyma and groups of spiral or annular vessels accompanied by thin-walled parenchyma.

B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 1.0 g of garlic powder add 5.0 ml of *methanol R*, shake for 60 s and filter.

Reference solution. Dissolve 5 mg of *alanine R* in 10 ml of *water R* and dilute to 20 ml with *methanol R*.

Apply separately to the plate, as bands, 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *propanol R*, 20 volumes of *water R* and 40 volumes of *ethanol R*. Allow the plate to dry in air. Spray with a 2 g/l solution of *ninhydrin R* in a mixture of 5 volumes of *glacial acetic acid R* and 95 volumes of *butanol R* and heat at 105 °C to 110 °C for 5 min to 10 min. Examine in daylight. The chromatogram obtained with the reference solution shows a violet zone (alanine) in its central third. The chromatogram obtained with the test solution shows a violet or brownish-red zone similar in position to that in the chromatogram obtained with the reference solution and corresponding to alliin; above and below this zone are other, generally fainter, violet zones.

TESTS

Starch. Examine the powdered drug under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100-105 °C.

Total ash (2.4.16). Not more than 5.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29), using *butyl parahydroxybenzoate R* as the internal standard. Carry out the assay as quickly as possible.
